Python Module Index

i

Index

SODAR Core is a framework for Django web application development.

It was conceived to facilitate the creation of scientific data management and analysis web applications, but can be useful in other contexts as well. In that it is similar to the CMS or ecommerce frameworks that you can find Awesome Django List but you will find the components/libraries provided in SODAR Core are more generic and in this reflecting the broader range of applications that we target.

ONE

HOW TO READ THIS MANUAL

There are two ways:

Front to Back

If you have the time and patience, reading the whole manual will teach you everything.

Jump Around (recommended)

Start with *For the Impatient* and/or *User Stories*, skim over the summary of each app, and explore what interests you most.

TWO

WHAT SODAR CORE IS AND WHAT IT IS NOT

SODAR Core

- is Django-based and you will need some knowledge about Django programming in Python for it to be useful,
- provides you with libraries for developing your own applications.

SODAR Core

- is NOT a ready-made web application,
- is NOT for entry-level Python programmers (you will need intermediate Django knowledge; you probably do not want to base your first Django web application on SODAR Core).

THREE

WHAT'S INSIDE SODAR CORE

The full list of apps are shown in the table of contents (on the left if you are reading the HTML version of this documentation). Here are some highlights:

- Project-based user access control
- Dynamic app content management
- Advanced project activity logging
- Small file uploading and browsing
- Managing server-side background jobs
- Caching and aggregation of data from external services
- Tracking site information and statistics

FOUR

WHAT'S INSIDE THIS DOCUMENTATION

Overview & Getting Started

This part aims at getting you an birds-eye view of SODAR Core and its usage.

SODAR Core Apps

This part documents each Django app that ships with SODAR. As a reminder, in Django development, *apps* are re-useable modules with code for supporting a certain use case.

Project Info

This part of the documentation provides meta information about the project and the full changelog.

WHAT'S NOT INSIDE THIS DOCUMENTATION

You should know the following before this documentation is useful to you:

Python Programming

There's tons of documentation on the internet but the official Python documentation is a good starting point as any.

Django Development

For learning about Django, head over to the excellent documentation of the Django Project.

HTML / Javascript / CSS / Bootstrap 4

Together with Django, SODAR Core provides a framework to plug in your own HTML and related front-end code. We assume that you have web development experience and in particular know your way around Bootstrap 4.

We're using the Bootstrap 4 CSS framework and you can learn about it in many places including the official documentation

Note: You can find the official version of this documentation at readthedocs.io. If you view these files on GitHub, beware that their renderer does not render the ReStructuredText files correctly and content may be missing.

5.1 SODAR Core Overview and Example Use Case

This document presents an overview of the SODAR Core package along with an example use case.

SODAR Core is a relatively complex system and we have created a *Glossary* to help you with keeping track of the terminology.

5.1.1 SODAR Core Overview

The SODAR Core package provides a suite of *Django apps* to be installed on a *Django-based web site*. The main app in the package, projectroles, provides core project access, content management framework and default UI templates for other apps on the site. Those apps must implement or use specific parts of the projectroles app to enable desired SODAR Core functionality.

Apps in a SODAR Core based site are separated into *project*, *site* and *backend* apps, depending on their scope and purpose. The SODAR Core package includes optional general purpose apps of each type, which the user may enable on their site if needed. These apps all depend on projectroles. More on the general purpose apps can be found in the *Getting Started* document.

To build their own web based system with SODAR Core, the user will develop required functionality and UIs as one or more Django apps, using and extending functionalities offered by the projectroles app and optional backend apps.

This allows integration of the app into the project access management, standardized layout and other features such as advanced logging. Furthermore, the projectroles app will call certain functions implemented in the user's apps to dynamically include app and project content in Django views. In addition to developing new Django apps, existing apps can be easily modified to gain access to SODAR Core features.

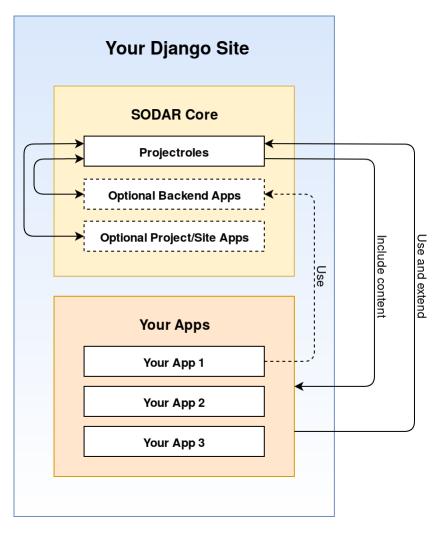

Fig. 1: Structure of a SODAR Core based web site

5.1.2 Example Use Case

In a typical scenario for SODAR Core use, a research organization wants to develop a user friendly system for accessing, browsing and/or manipulating research data. The data may belong to several different projects, with different research groups or scientists working on it. This data may be confidential in nature, so access control is required, preferably using the organization's existing LDAP/AD servers. The organization wants to provide a web-based GUI as well as programmatic API views.

Site Setup

First the developer will *set up a SODAR Core based Django site*. This can be created from a SODAR Core site template or by integrating the django-sodar-core package on an existing site. The Django site must be configured according to organization requirements, e.g. setting up user access via the organization LDAP/AD server.

The initial SODAR Core integration into a Django site adds e.g. a general layout, organization of apps and content into projects as well as project-based access control.

App Development

Next the developer needs to *develop the Django app(s)* which contain the actual program logic and user interfaces required for the use case. The content or number of these apps are not restricted by SODAR Core. Anything which would go to a typical Django app is OK, as long as certain building blocks for SODAR Core functionality are used.

Optional applications bundled with SODAR Core can also be enabled or disabled at this point. for example, if involved projects require sharing and storage of reports and presentations, the developer may select to enable the *filesfolders* app. Likewise, if detailed logging or audit trails are needed, the developer can enable the *timeline* app.

User and Project Setup

Once the site is deployed, the developer should *create initial project categories* and provide access to those for high level personnel such as project owners. The owners can then go on and create relevant projects, grant access to researchers and set up initial data in the applications.

Using the Site

The researchers will log in to the site on their web browser, in most cases using the standard LDAP credentials provided by their organization. They will see the projects they have been granted access to and can use whichever applications have been enabled or developed for the site, according to their assigned user rights. SODAR Core provides common navigation, overview and search views for all enabled apps, including the one(s) developed by the organization. The same user access management features are shared for all apps, along with possible REST APIs developed by the organization.

5.1.3 Next Steps

See the *Getting Started* document for instructions on installing SODAR Core and how to proceed with developing your own SODAR Core based site.

5.2 Getting Started

Installation and basic concepts of the SODAR Core framework and its apps are detailed in this document.

5.2.1 Installation

The django-sodar-core package can be installed into your Django project from PyPI as follows. It is strongly recommended to specify a version tag, as the package is under active development and breaking changes are expected.

```
pip install django-sodar-core==0.11.1
```

Please note that the django-sodar-core package only installs *Django apps*, which you need to include in a *Django web site* project. For instructions for integrating SODAR Core into an existing Django site or setting up a new site, see the *projectroles app documentation*.

5.2.2 SODAR Core Apps

The following Django apps will be installed when installing the django-sodar-core package:

- **projectroles**: Base app for project access management and dynamic app content management. All other apps require the integration of projectroles.
- adminalerts: Site app for displaying site-wide messages to all users.
- appalerts: Site app and backend for raising alerts to users from apps.
- bgjobs: Project app for managing background jobs.
- siteinfo: Site app for displaying site information and statistics for administrators.
- sodarcache: Generic caching and aggregation of data referring to external services.
- timeline: Project app for logging and viewing project-related activity.
- tokens: Token management for API access.
- userprofile: Site app for viewing user profiles.

5.2.3 Requirements

Major requirements for integrating projectroles and other SODAR Core apps into your Django site are listed below. For a complete requirement list, see the requirements and utility directories in the repository.

- Ubuntu (20.04 Focal recommended and supported) / CentOS 7
- System library requirements (see the utility directory and/or your own Django project)
- Python >=3.8 (NOTE: Python 3.7 no longer supported in SODAR Core v0.10.8+)
- Django 3.2
- PostgreSQL >=11 and psycopg2-binary
- Bootstrap 4.x
- JQuery 3.3.x
- · Shepherd and Tether
- Clipboard.js
- DataTables

For more details on installation and requirements for local development, see Development Installation.

5.2.4 Next Steps

To proceed with using the SODAR Core framework in your Django site, you must first install and integrate the projectroles app. See the *projectroles app documentation* for instructions.

Once projectroles has been integrated into your site, you may proceed to install other apps as needed.

5.3 For the Impatient

This section will give you the essential steps to setup a new SODAR Core based project. We will link to the parts of the manual where they were taken from such that you can read more in depth there.

5.3.1 See It In Action

We have developed the following data management and analysis web applications using SODAR Core. Although there only is a public demo available for VarFish at this time, the source code of the applications demonstrate how to use SODAR Core in complex web applications.

SODAR

The system for Omics data access and retrieval. This system is used to model study metadata and manage associated data files in different Omics research projects. SODAR Core was created by separating re-usable research project management components from the SODAR project.

VarFish

A web-based tool for the analysis of variants. It showcases how to build a complex data warehousing and data analysis web appliction using SODAR Core. More details are described in the NAR Web Server Issue publication (doi:10.1093/nar/gkaa241). The source code can be found on github.com/bihealth/varfish-server. A demo is available at varfish-demo.bihealth.org.

DigestiFlow

A web-based data system for the management and demultiplexing of Illumina Flow Cells. It further implements various tools for sanity checking Illumina sample sheets and quality control (e.g., comparing barcode adapter sequence and actual sequence present in the sequencer output). You can find out more in our publication in Bioinformatics (doi:10.1093/bioinformatics/btz850). The source code can be found on github.com/bihealth/digestiflow-server. There currently is no public demo instance yet.

Kiosc

A web application that allows to build scheduler Docker containers for "data science" apps and dashboards. There currently is no public demo instance yet.

5.3.2 Download Example Site

The recommended way to get started with SODAR Core is to download and set up the example Django site, which installs SODAR Core and also sets up a default web site around it.

We maintain a Git repository with a django project using the latest SODAR Core version here on GitHub: sodar-djangosite. See *Projectroles Integration* on other ways to get started with SODAR Core.

To clone the example site, do the following:

```
$ git clone https://github.com/bihealth/sodar-django-site.git
$ cd sodar-django-site
```

5.3.3 Example Site Setup

The process of installing required dependencies and setting up your example site is the same as for SODAR Core itself. For a step-by-step guide, see *Development Installation*.

Note: This guide and associated helper scripts are targeting Ubuntu 20.04. For other Linux distributions or operating systems, you may have to adjust them as required. This is out of the scope of this documentation.

5.3.4 The First Login

To access the site, start the server with make serve and use your web browser to navigate to the following URL: http://127.0.0.1:8000

```
$ make serve
python manage.py runserver --settings=config.settings.local
(...)
Starting development server at http://127.0.0.1:8000/
Quit the server with CONTROL-C.
```

You should see the following:

🖞 SODAR Django Site Template Beta		🛛 Extra Link	Help	<u>♣</u> ▼
	Login Please log in.			
	username			
	password			
	된 Login			

Fig. 2: Login view

Login with the superuser account you created. Afterwards you are redirected to your home view:

🖞 SOD	OAR Django Site Template <mark>Beta</mark>	1	Search term	Search	Extra Link	i Help	0 -
Home	Home						
Create Category	S All Projects			a Starred	Filter		
	Project / Category					Your Role	•
		No proje	ects have been created.				

Fig. 3: Project list

By clicking the user icon on the top right corner you can access the Django admin (where you can create more users,

for example) but also the preconfigured *site apps Adminalerts*, *Siteinfo*, *Userprofile* and configuration for remote sites. The *Create Category* link on the left hand sidebar allows you to create new categories.

Now might also be a good time to read up more on the *Projectroles* app as this is the fundamental app for most further development.

5.3.5 The First Project

Creating projects on the root level is not allowed by default, so you have to create a new category first. A category is a collection of projects and/or subcategories. First click the *Create Category* link on the sidebar to create an "Example Category". This takes you to the view of the newly created category. Next, click the *Create a Project or Category* link to create an "Example Project" within. The project details view should look as follows.

🖞 SODA	AR Django Site Templ	late Beta		🐟 Search term	Search	Extra Link	i Help	0 -		
↑ Home	♠ Home / Example Cat									
			×							
Project Overview										
Small Files										
Timeline	No ReadMe is currently set for this project. You can update the ReadMe here.									
Background	Small Files Overview							0		
Jobs	Name	Size	Descripti	on	Owner	Updated				
Members	No files or links									
Update Project	Timeline Over	erview						0		
	Timestamp	Event	User	Description			Sta	tus		
	2022-02-15 17:07:43	project_create	admin	create project with admir	as owner		ОК			

Fig. 4: Project details view

At this point you can test the search functionality. Typing "example" into the text field on the top bar and clicking *Search* will return your example project. The project overview shows the *overview card* for installed project apps Filefolders, Timeline, and Bgjobs. Usually, the five most recent entries are shown here.

Note: The Filesfolders app is an example of the **data management** application of SODAR Core based apps. You can easily imagine a more advanced module/app that not only allows tagging of files but more structuring data and meta data more strongly.

Go ahead and try out the Filesfolders app by clicking the *Small Files* link on the sidebar. After creating folders and uploading a few files, you will see a trace of actions in the Timeline app:

Note: By default, sodar-django-site will store the files in the PostgreSQL database. You can easily configure it to use other storage backends, e.g., the S3 protocol, with the django-storage package, but is beyond the scope of this

🖞 SOD	AR Django Site Temp	late Beta		Search term	Search	Extra Link	 Helphanel 	p 19 -
fan Home	A Home / Example Ca	tegory / Example Pr	roject					
Project	Example Pr	oject 🕁

Fig. 5: Timeline app

documentation.

You will now also be able to find your uploaded file by name through the search box. Note that any app that you write can easily provide all the integrations with the SODAR Core framework, as your apps are no different than the built-in ones. Just have a look how we did it in the apps shipping with SODAR Core.

5.3.6 Summary

Here is a quick summary on how SODAR Core interacts with the built-in and user apps:

- At the lower most level all content is managed in projects which themselves can be assigned into categories.
- Project apps can provide new content types that can be put into projects. For example, the Filesfolders app allows you to store files, folders, and assign meta data to them. As another example, the timelines app stores events that occured in a project, and other apps such as the Filesfolders app can register their events with it.
- SODAR Core defines several plugin extension points that your apps can implement and make their content findable, for example.
- Site apps allow to provide features independent of a project. For example, the userprofile app allows to access user settings and the adminalerts app allows to post global notifications.

5.3.7 Going on From Here

- You can now start exploring your sodar-django-site and play around with it.
- You can read the User Stories section to learn how SODAR Core based applications are built.
- Continue reading *Getting Started* for a more comprehensive documentation and walk-through of SODAR Core and its apps.
- Have a look at the web apps developed by us that are using SODAR Core as shown in the See It In Action section.

5.4 User Stories

This section explains how SODAR Core based web applications are built on a very high level. We assume that you have read the *For the Impatient* section and are basing your web application on the SODAR Core example site as described there. Also, we assume that you have intermediate experience with Django and Python programming.

Please also note that the term *web app* refers to the overall *Django site*, that is what the user sees and what is commonly referred to as a "web application" or "dynamic website".

The term Django app refers to the technical term within Django development, that is a "Django app Python package".

5.4.1 Flow Cell Data Management

On a very high level here is how SODAR Core was used to built Digestiflow (cf. See It In Action). You can find the source code in the Github project.

The aim is to manage the meta data for sequencers and flow cells.

SODAR Core App Configuration

- Configure your Django site to use the projectroles SODAR Core Django app. Each SODAR Core "project" corresponds to one site and this would allow to have multiple groups manage their sequencing meta data in the same web app instance.
- Configure the timeline SODAR Core Django app to provide an audit trail of changes to data.
- Configure the filesfolders SODAR Core Django app to manage small file uploads in various places.

Custom Apps

The following description uses domain-specific language from the high-throughput sequencing domain. While this makes the section harder to understand to the layperson, explaining the different terms is out of scope in this manual.

- Write the sequencers app for management of sequencing machines.
- Write the barcodes app for management of the barcode adapter sets.
- Write the flowcells app for managing flow cells and libraries. This app depends on sequencers and barcodes for these apps' Django models.

5.4.2 Variant Analysis

On a very high level here is how SODAR Core was used to built VarFish (cf. *See It In Action*). You can find the source code in the Github project.

The aim is to provide an data analysis web application.

SODAR Core App Configuration

- Configure your Django site to use the projectroles SODAR Core Django app. Each SODAR Core "project" corresponds to one site and this would allow to have multiple groups manage their sequencing meta data in the same web app instance.
- Configure the timeline SODAR Core Django app to provide an audit trail of changes to data.
- Configure the bgjobs SODAR Core Django app to manage asynchronous jobs, such as long-running queries.

Custom Apps

The following description uses domain-specific language from the medical genetics domain. While this makes the section harder to understand to the layperson, explaining the different terms is out of scope in this manual.

- Write various Django apps for importing background data such as population frequencies from the gnomAD project, genes, etc.
- Write the variants app to implement the actual variant filtration. This is the core part of Varfish and provides the different Django models, views, and templates to actually perform the variant filtration.
- Write the importer app to implement efficient bulk import of variants from annotated TSV files.

5.5 Glossary

App Plugin

Mechanism for defining common properties and operations for dynamically including content and functionality from apps in SODAR Core views.

App Settings

Project or user specific settings defined in SODAR Core app plugins. Different from e.g. Django settings used to configure the web site.

Backend App

SODAR Core application which is used to provide additional functionality to other SODAR Core apps. Does not have its own GUI entry point. Common use cases include APIs to external services or other apps.

Backend API

Django API provided by a backend app, to be dynamically imported and used by other SODAR Core based Django apps.

Django API

Application programming interface offered by an app, to be used by other apps within the Django site.

Django App

Application built for the Django web framework, including (but not limited to) SODAR Core based apps.

Django Settings

Django settings used to configure the website. SODAR Core apps also use Django settings for configuring framework and app behaviour.

Django Site

Web site built on the Django framework, including (but not limited to) any website based on SODAR Core.

Peer Site

A SODAR Core based web site which mirrors one or more projects also mirrored on the currrently active site. This allows linking to remote projects on other sites where the user would have access.

Project App

SODAR Core application with the scope of providing data and functionality related to a specific project. Uses project-based access control.

SODAR

System for Omics Data Access and Retrieval. An omics research data management system which is the origin of the reusable SODAR Core framework.

SODAR Core

Core framework and reusable apps originally built for the SODAR project.

SODAR Core App

Django application with additional SODAR Core features. This includes one or more app plugin definitions to enable dynamic inclusion of the app into the SODAR Core framework, as well as project access control for project apps.

SODAR Core Based Site

Django-based web site using SODAR Core apps as its framework.

Site App

SODAR Core application with does not limit its scope to a single project. Common use cases include user account management and administrative tools.

Source Site

SODAR Core based web site which mirrors project metadata and access control to "target" sites.

Target Site

SODAR Core based web site which mirrors project metadata and access control from a "source" site.

5.6 Projectroles App

The projectroles app is the base app for building a *SODAR Core based Django site*. It provides a ramework for project access management, dynamic content retrieval, models and tools for SODAR-compatible apps plus a default template and CSS layout.

Other Django apps which intend to use aforementioned functionalities depend on projectroles. While inclusion of other SODAR Core apps can be optional, having projectroles installed is **mandatory** for working with the SODAR Core project and app structure.

5.6.1 Projectroles Basics

The basic concepts and functionalities of the projectroles app are detailed in this document.

Projects

The projectroles app groups data into **projects**. Here, a **project** is a data container object that other objects can be linked to (typically through a 1:n foreign key relationship). A **category** is a sub-type of a project which is allowed to contain other categories and projects but no other data type.

Using categories and projects, data can be organized in a tree structure of category and project "containers". Users can be granted access to projects using roles as described in the next section.

User Roles in Projects

A **role** is a data type that has a string identifier in it score (e.g., "project guest"). Roles are assigned to individual users in the context of individual projects (a n:m relation from user to project with the string identifier). For example, user "paul" might be assigned the "project guest" role in one project and another (or no) role in a second project. Users can only have one role in a given project at any given time. New types of roles can be defined by extending the default model's database table of the projectroles app.

The default setup of role types used in SODAR sites:

- Project Owner
 - Full read/write access to project data and roles
 - Can create sub-projects under owned categories
 - One per project
 - Must be specified upon project creation
- Project Delegate
 - Full read/write access to project data
 - Can modify roles except for owner and delegate
 - One per project (by default, the limit can be increased in site settings)
 - Assigned by owner
- Project Contributor
 - Can read and write project data
 - Can modify and delete own data
- Project Guest
 - Read only access to project data

Note: Django superuser status overrides project role access.

The projectroles app provides the following features for managing user roles in projects:

- Adding/modifying/removing site users as project members
- Inviting people not yet using the site by email
- · Automated emailing of users regarding role changes
- Mirroring user roles to/from an external projectroles-enabled site

Note: Currently, only superusers can assign owner roles for top-level categories.

Remote Project Sync

SODAR Core allows optionally reading and synchronizing project metadata between multiple SODAR-based Django sites. A superuser is able to set desired levels of remote access for specific sites on a per-project basis.

A SODAR site can have one of three modes: source, target or peer mode.

A SODAR site can be set by the user in either source or target mode.

- Source site is one expecting to (potentially) serve project metadata to an arbitrary number of other SODAR sites.
- **Target site** can be linked with exactly one source site, from which it can retrieve project metadata. Creation of local projects can be enabled or disabled according to local configuration.
- **Peer** mode is used only if two or more Target sites link to the same Source site. If synchronizing a project which has multiple accessing Target sites, metadata about those other Target sites is included and stored in Peer mode site objects.

Among the data which can be synchronized:

- General project information such as title, description and readme
- Project category structure
- User roles in projects
- User accounts for LDAP/AD users (required for the previous step)
- Information of other Target Sites linking a common project

Rule System

Projectroles uses the django-rules package to manage permissions for accessing data, apps and functionalities within projects based on the user role. Predicates for project roles are provided by the projectroles app and can be used and extended for developing rules for your other project-specific Django apps.

App Plugins

Projectroles provides a plugin framework to enable integrating apps and content dynamically to a projectroles-enabled Django site. Types of apps and corresponding app plugins currently included:

- **Project apps**: Apps related to specific projects, making use of project access control and providing data and content within the project's scope
- Site apps: Site-wide Django apps which are not project-specific
- **Backend apps**: Backend apps without a GUI entry point, imported and used dynamically by other SODAR-based apps for e.g. connectivity to external resources.

App plugins are not limited to one per Django app. A single Django app in SODAR Core may contain one or more of the aforementioned plugin types, depending on the required functionality.

Existing apps can be modified to conform to the plugin structure by implementing certain variables, functions, views and templates within the app. For more details, see the app development documents.

Other Features

Other features in the projectroles app:

- **App settings**: Setting values for project or user specific variables, which can be defined in project and site app plugins
- Project starring: Ability for users to star projects as their favourites
- **Project search**: Functionality for searching data within projects using functions implemented in project app plugins
- Tour help: Inline help for pages
- Project readme: README document for each project with Markdown support
- Custom user model: Additions to the standard Django user model
- Multi-domain LDAP/AD support: Support for LDAP/AD users from multiple domains
- **SODAR Timeline integration**: Included but disabled unless the backend app for Timeline is enabled in your Django site

Templates and Styles

Projectoles provides views and templates for all GUI-related functionalities described above. The templates utilize the plugin framework to provide content under projects dynamically. The project also provides default CSS stylings, base templates and a base layout which can be used or adapted as needed. See the usage and app development documentation for more details.

5.6.2 Projectroles Integration

This document provides instructions and guidelines for integrating projectroles and other SODAR Core apps into your Django site.

Installation on a New Site

If you want to set up a new Django site for integrating projectroles, see the recommended options in this section.

SODAR Django Site Template (Recommended)

When setting up a new *SODAR Core based site*, it is strongly recommended to use sodar-django-site as the template. The repository contains a minimal *Django site* pre-configured with projectroles and other *SODAR Core apps*. The main branch of this project always integrates the latest stable release of SODAR Core and projectroles.

To set up your site with this template, clone the repository and follow the installation instructions in the README.rst file.

To modify default SODAR Core and projectroles settings, see the Projectroles Django Settings document.

Once you have your site set up, you can look into *customization tips* and start *developing your SODAR Core compatible apps*.

Cookiecutter-Django

If the SODAR Django site template does not suit your needs, it is also possible to set up your site using cookiecutterdjango. In this case, follow the instructions in the following section as if you were integrating SODAR Core to an existing Django site.

Note: The project was created using an old version of the cookiecutter script and evolved from there. This means the site created by the version currently may differ in several ways from how SODAR Core is set up. This method is recommended only for experienced Django developers.

Note: For any other issues regarding the cookiecutter-django setup, see the cookiecutter-django documentation.

Installation on an Existing Site

Instructions for setting up projectroles and SODAR Core on an existing Django site or a fresh site generated with cookiecutter-django are detailed in this chapter.

Warning: In order to successfully set up projectroles, you are expected to **follow all the instructions here in the order they are presented**. Please note that leaving out steps may result in a non-working Django site! Attempting to run the site before following all of the steps may (and probably will) result in errors.

Warning: The rest of this section was originally written for the 1.11 release of cookiecutter-django. Some details such as directory structures and settings variables may differ.

First, add the django-plugins and django-sodar-core package requirements into your requirements/base. txt file. Make sure you are pointing to the desired release tag or commit ID.

-e git+https://github.com/mikkonie/django-plugins.
→git@42e86e7904e5c09f1da32173862b26843eda5dd8#egg=django-plugins
django-sodar-core==0.11.1

Install the requirements for development:

\$ pip install -r requirements/local.txt

If any version conflicts arise between django-sodar-core and your existing site, you will have to resolve them before continuing.

Hint: You can always refer to either the sodar-django-site repository or example_site in the SODAR Core repository for a working example of a Cookiecutter-based Django site integrating SODAR Core. However, note that some aspects of the site configuration may vary depending on the cookiecutter-django version used on your site.

Django Settings

Next you need to modify your default *Django settings* file, usually located in config/settings/base.py. For sites created with an older cookiecutter-django version the file name may also be common.py. Naturally, you should make sure no settings in other configuration files conflict with ones set here.

For values retrieved from environment variables, make sure to configure your env accordingly. For development and testing, using READ_DOT_ENV_FILE is recommended.

Required and optional Django settings are described in the Projectroles Django Settings document.

User Configuration

In order for SODAR Core apps to work on your Django site, you need to extend the default user model.

Extending the User Model

In a cookiecutter-django based project, an extended user model should already exist in {SITE_NAME}/users/models. py. The abstract model provided by the projectroles app provides the same model with critical additions, most notably the sodar_uuid field used as an unique identifier for SODAR objects including users.

If you have not added any of your own modifications to the model, you can simply **replace** the existing model extension with the following code:

```
from projectroles.models import SODARUser
```

```
class User(SODARUser):
    pass
```

If you need to include your own extra fields or functions (or have existing ones already), you can add them in this model.

After updating the user model, create and run database migrations.

```
$ ./manage.py makemigrations
$ ./manage.py migrate
```

Note: You probably will need to edit the default unit tests under {SITE_NAME}/users/tests/ for them to work after making these changes. See example_site.users.tests in this repository for an example.

Populating UUIDs for Existing Users

When integrating projectroles into an existing site with existing users, the sodar_uuid field needs to be populated. See instructions in Django documentation on how to create the required migrations.

Synchronizing User Groups for Existing Users

To set up user groups for existing users, run the syncgroups management command.

\$./manage.py syncgroups

User Profile Site App

The userprofile site app is installed with SODAR Core. It adds a user profile page in the user dropdown. Use of the app is not mandatory but recommended, unless you are already using some other user profile app. See the *userprofile app documentation* for instructions.

Add Login Template

You should add a login template to {SITE_NAME}/templates/users/login.html. If you're OK with using the projectroles login template, the file can consist of the following line:

```
{% extends 'projectroles/login.html' %}
```

If you intend to use projectroles templates for user management, you can delete other existing files within the directory.

URL Configuration

In the Django URL configuration file, usually found in config/urls.py, add the following lines under urlpatterns to include projectroles URLs in your site.

```
urlpatterns = [
    # ...
    url(r'api/auth/', include('knox.urls')),
    url(r'^project/', include('projectroles.urls')),
]
```

If you intend to use projectroles views and templates as the basis of your site layout and navigation (which is recommended), also make sure to set the site's home view accordingly:

```
from projectroles.views import HomeView
urlpatterns = [
    # ...
    url(r'^$', HomeView.as_view(), name='home'),
]
```

Finally, make sure your login and logout links are correctly linked. You can remove any default allauth URLs if you're not using it.

```
from django.contrib.auth import views as auth_views
urlpatterns = [
    # ...
    url(r'^login/$', auth_views.LoginView.as_view(
```

(continues on next page)

(continued from previous page)

```
template_name='users/login.html'), name='login'),
url(r'^logout/$', auth_views.logout_then_login, name='logout'),
```

Base Template for Your Django Site

]

In order to make use of Projectroles views and templates, you should set the base template of your site accordingly in {SITE_NAME}/templates/base.html.

For a supported example, see projectroles/base_site.html. It is strongly recommended to use this as the base template for your site, either by extending it or copying the content into {SITE_NAME}/templates/base.html and modifying it to suit your needs.

If you do not need to make any modifications, the most simple way is to replace the content of the {SITE_NAME}/templates/base.html file with the following line:

{% extends 'projectroles/base_site.html' %}

Note: CSS and Javascript includes in site_base.html are **mandatory** for Projectroles-based views and functionalities.

Note: The container structure defined in the example base.html, along with including the {STATIC}/projectroles/css/projectroles.css are **mandatory** for Projectroles-based views to work without modifications.

Site Error Templates

The projectroles app contains default error templates to use on your site. These are located in the projectroles/ error/ template directory. You can use them by entering {% extends 'projectroles/error/*.html %} in the corresponding files found in the {SITE_NAME}/templates/ directory. You have the options of extending or replacing content on the templates, or simply implementing your own.

Site Icons

SODAR Core uses Iconify to include icons on the site. SODAR Core apps use the Material Design Icons icon collection, however other collections can be added to your site.

To enable the icons on your site, run the following management commands:

```
$ ./manage.py geticons
$ ./manage.py collectstatic
```

If you want to use additional icon collections, you can add them using the -c argument as displayed in the following example:

```
$ ./manage.py geticons -c carbon clarity
```

You can view the supported icon collections here.

The Iconify JSON files are rather large and potentially frequently updated, so it is recommended to ignore them in your Git setup and instead retrieve them dynamically for CI and deployment. Before committing your code, it is recommended to update your .gitignore file with the following lines:

```
*/static/iconify/*.json
*/static/iconify/json/*.json
```

All Done!

After following all the instructions above, you should have a working SODAR Core based Django site with support for projectroles features and SODAR Core apps. To test the site locally execute the supplied make command:

\$ make serve

Or, run the standard Django runserver command:

\$./manage.py runserver

You can now browse your site locally at http://127.0.0.1:8000. You are expected to log in to view the site. Use e.g. the superuser account you created when setting up your cookiecutter-django site.

You can now continue on to create apps or modify your existing apps to be compatible with the SODAR Core framework. See the *development section* for app development guides. Also see the *customization documentation* for tips for modifying the default appearance of SODAR Core.

5.6.3 Projectroles Django Settings

This document describes the *Django settings* for the projectroles app, which also control the configuration of other apps in a SODAR Core based site.

These settings are usually found in config/settings/*.py, with config/settings/base.py being the default configuration other files may override or extend.

If your site is based on sodar-django-site, mandatory settings are already set to their default values. In that case, you only need to modify or customize them where applicable.

If you are integrating django-sodar-core with an existing Django site or building your site from scratch without the recommended template, make sure to add all mandatory settings into your project.

For values retrieved from environment variables, make sure to configure your env accordingly. For development and testing, it is highly recommended to set DJANGO_READ_DOT_ENV_FILE=1 in your system's environment variables and place the env variables into a .env file in the root directory of your Django site repository. See env.example for an example of such a file.

Site Package and Paths

The site package and path configuration should be found at the beginning of the default configuration file. Substitute {SITE_NAME} with the name of your site package.

```
import environ
SITE_PACKAGE = '{SITE_NAME}'
ROOT_DIR = environ.Path(__file__) - 3
APPS_DIR = ROOT_DIR.path(SITE_PACKAGE)
```

Apps

Apps installed from django-sodar-core are placed in THIRD_PARTY_APPS. The following apps need to be included in the list in order for SODAR Core to work:

```
THIRD_PARTY_APPS = [
    # ...
    'crispy_forms',
    'rules.apps.AutodiscoverRulesConfig',
    'djangoplugins',
    'pagedown',
    'markupfield',
    'rest_framework',
    'knox',
    'projectroles.apps.ProjectrolesConfig',
    'dal',
    'dal_select2',
    'dj_iconify.apps.DjIconifyConfig',
]
```

Database

Under DATABASES, the setting below is recommended:

```
DATABASES['default']['ATOMIC_REQUESTS'] = False
```

Note: If this conflicts with your existing set up, you can modify the code in your other apps to use e.g. @transaction. atomic.

Templates

Under TEMPLATES['OPTIONS']['context_processors'], add the required projectroles processors:

```
'projectroles.context_processors.urls_processor',
'projectroles.context_processors.site_app_processor',
```

Email

Under EMAIL_CONFIGURATION or EMAIL, configure email settings:

```
EMAIL_SENDER = env('EMAIL_SENDER', default='noreply@example.com')
EMAIL_SUBJECT_PREFIX = env('EMAIL_SUBJECT_PREFIX', default='')
```

Authentication

AUTHENTICATION_BACKENDS should contain the following backend classes:

```
AUTHENTICATION_BACKENDS = [
    'rules.permissions.ObjectPermissionBackend',
    'django.contrib.auth.backends.ModelBackend',
]
```

Note: The default setup by cookiecutter-django adds the allauth package. This can be left out of the project if not needed, as it mostly provides adapters for e.g. social media account logins. If removing allauth, you can also remove unused settings variables starting with ACCOUNT_*.

The following settings remain in your auth configuration:

```
AUTH_USER_MODEL = 'users.User'
LOGIN_REDIRECT_URL = 'home'
LOGIN_URL = 'login'
```

lcons

The ICONIFY_JSON_ROOT setting must point to the appropriate path within your static files directory in order to make icons work on your SODAR Core based site.

ICONIFY_JSON_ROOT = os.path.join(STATIC_ROOT, 'iconify')

Django REST Framework

To enable djangorestframework API views and knox authentication, these values should be added under DEFAULT_AUTHENTICATION_CLASSES:

```
REST_FRAMEWORK = {
    'DEFAULT_AUTHENTICATION_CLASSES': (
        'rest_framework.authentication.BasicAuthentication',
        'rest_framework.authentication.SessionAuthentication',
        'knox.auth.TokenAuthentication',
    ),
}
```

General Site Settings

For display in projectroles based templates, customize related variables to describe your site. SITE_INSTANCE_TITLE may be used to e.g. differentiate between site versions used for deployment or staging, use in different organizations, etc.

```
SITE_TITLE = 'Name of Your Project'
SITE_SUBTITLE = env.str('SITE_SUBTITLE', 'Beta')
SITE_INSTANCE_TITLE = env.str('SITE_INSTANCE_TITLE', 'Deployment Instance Name')
```

Projectroles Settings

Mandatory projectroles app settings are explained below:

- PROJECTROLES_SITE_MODE: Site mode for remote project metadata synchronization, either SOURCE (allow others to read local projects) or TARGET (read projects from another site)
- PROJECTROLES_TARGET_CREATE: Whether or not local projects can be created if site is in TARGET mode. If your site is in SOURCE mode, this setting has no effect.
- PROJECTROLES_INVITE_EXPIRY_DAYS: Days until project email invites expire (int)
- PROJECTROLES_SEND_EMAIL: Enable/disable email sending (bool)
- PROJECTROLES_EMAIL_SENDER_REPLY: Whether replies are expected to the sender address (bool). If set False and nothing is set in the reply-to header, a "do not reply" note is added to the email body.
- PROJECTROLES_ENABLE_SEARCH: Whether you want to enable SODAR search on your site (boolean)
- PROJECTROLES_DEFAULT_ADMIN: User name of the default superuser account used in e.g. replacing an unavailable user or performing backend admin commands (string)

Example:

```
# Projectroles app settings
PROJECTROLES_SITE_MODE = env.str('PROJECTROLES_SITE_MODE', 'TARGET')
PROJECTROLES_TARGET_CREATE = env.bool('PROJECTROLES_TARGET_CREATE', True)
PROJECTROLES_INVITE_EXPIRY_DAYS = env.int('PROJECTROLES_INVITE_EXPIRY_DAYS', 14)
PROJECTROLES_SEND_EMAIL = env.bool('PROJECTROLES_SEND_EMAIL', False)
PROJECTROLES_EMAIL_SENDER_REPLY = env.bool('PROJECTROLES_EMAIL_SENDER_REPLY', False)
PROJECTROLES_ENABLE_SEARCH = True
PROJECTROLES_DEFAULT_ADMIN = env.str('PROJECTROLES_DEFAULT_ADMIN', 'admin')
```

Optional Projectroles Settings

The following projectroles settings are optional:

- PROJECTROLES_EMAIL_HEADER: Custom email header (string)
- PROJECTROLES_EMAIL_FOOTER: Custom email footer (string)
- PROJECTROLES_SECRET_LENGTH: Character length of secret token used in projectroles (int)
- PROJECTROLES_SEARCH_PAGINATION: Amount of search results per each app to display on one page (int)
- PROJECTROLES_HELP_HIGHLIGHT_DAYS: Days for highlighting tour help for new users (int)
- PROJECTROLES_DISABLE_CATEGORIES: If set True, disable categories and only allow a list of projects on the root level (boolean) (see note)

- PROJECTROLES_HIDE_APP_LINKS: Apps hidden from the project sidebar and dropdown menus for nonsuperusers. The app views and URLs are still accessible. The names should correspond to the name property in each project app's plugin (list)
- PROJECTROLES_DELEGATE_LIMIT: The number of delegate roles allowed per project. The amount is limited to 1 per project if not set, unlimited if set to 0. Will be ignored for remote projects synchronized from a source site (int)
- PROJECTROLES_BROWSER_WARNING: If true, display a warning to users using Internet Explorer (bool)
- PROJECTROLES_ALLOW_LOCAL_USERS: If true, roles for local non-LDAP users can be synchronized from a source during remote project sync if they exist on the target site. Similarly, local users will be selectable in member dropdowns when selecting users (bool)
- PROJECTROLES_KIOSK_MODE: If true, allow accessing certain project views *without* user authentication in order to e.g. demonstrate features in a kiosk-style deployment. Also hides and/or disables views not intended to be used in this mode (bool)
- PROJECTROLES_BREADCRUMB_STICKY: Set this false to make project breadcrumb navigation scroll along page content. If true, maintain a sticky breadcrumb below the titlebar instead. Assumed true if not set (bool)
- PROJECTROLES_ALLOW_ANONYMOUS: If true, allow anonymous users to access the site and all projects where public_guest_access is set true (bool)
- PROJECTROLES_SIDEBAR_ICON_SIZE: Set the icon size for the project sidebar. Minimum=18, maximum=42, default=36 (int)

Example:

```
# Projectroles app settings
# ...
PROJECTROLES_EMAIL_HEADER = 'This email has been sent by X from Y'
PROJECTROLES_EMAIL_FOOTER = 'For assistance contact admin@example.com'
PROJECTROLES_SECRET_LENGTH = 32
PROJECTROLES_SEARCH_PAGINATION = 5
PROJECTROLES_HELP_HIGHLIGHT_DAYS = 7
PROJECTROLES_DISABLE_CATEGORIES = True
PROJECTROLES_HIDE_APP_LINKS = ['filesfolders']
PROJECTROLES_DELEGATE_LIMIT = 1
PROJECTROLES_BROWSER_WARNING = True
PROJECTROLES_ALLOW_LOCAL_USERS = True
PROJECTROLES_KIOSK_MODE = False
```

Warning: Regarding PROJECTROLES_DISABLE_CATEGORIES: In the current SODAR core version remote site access and remote project synchronization are disabled if this option is used! Use only if a simple project list is specifically required in your site.

Warning: Regarding PROJECTROLES_ALLOW_LOCAL_USERS: Please note that this will allow synchronizing project roles to local non-LDAP users based on their **user name**. You should personally ensure that the users in question are authorized for these roles. Furthermore, only roles for **existing** local users will be synchronized. New local users will have to be added manually through the Django admin or shell on the target site.

Warning: The PROJECTROLES_KIOSK_MODE setting is under development and considered experimental. More implementation, testing and documentation is forthcoming.

Backend App Settings

The ENABLED_BACKEND_PLUGINS settings lists backend plugins implemented using BackendPluginPoint which are enabled in the configuration. For more information see *Backend App Development*.

ENABLED_BACKEND_PLUGINS = env.list('ENABLED_BACKEND_PLUGINS', None, [])

API View Settings (Optional)

If you want to build an API to your site using SODAR Core functionality, it is recommended to base your API views on projectroles.views.SODARAPIBaseView. Using this base class also allows you to define your API media type, version number and allowed versions via Django settings.

The recommended API setup uses accept header versioning. The SODAR_API_MEDIA_TYPE setting should be changed to your organization and API identification if API views are introduced. The SODAR_API_DEFAULT_HOST setting should post to the externally visible host of your server and be configured in your environment settings.

These settings are **optional**. Default values will be used if they are unset.

Example:

LDAP/AD Configuration (Optional)

If you want to utilize LDAP/AD user logins as configured by projectroles, you can add the following configuration. Make sure to also add the related env variables to your configuration.

This part of the setup is **optional**.

Note: In order to support LDAP, make sure you have installed the dependencies from utility/ install_ldap_dependencies.sh and requirements/ldap.txt! For more information see *Development Installation*.

Note: If only using one LDAP/AD server, you can leave the "secondary LDAP server" values unset.

```
ENABLE_LDAP = env.bool('ENABLE_LDAP', False)
ENABLE_LDAP_SECONDARY = env.bool('ENABLE_LDAP_SECONDARY', False)
if ENABLE_LDAP:
```

```
import itertools
```

(continued from previous page)

```
import ldap
from django_auth_ldap.config import LDAPSearch
# Default values
LDAP_DEFAULT_CONN_OPTIONS = {ldap.OPT_REFERRALS: 0}
LDAP_DEFAULT_FILTERSTR = '(sAMAccountName=%(user)s)'
LDAP_DEFAULT_ATTR_MAP = {
    'first_name': 'givenName',
    'last_name': 'sn',
    'email': 'mail'.
}
# Primary LDAP server
AUTH_LDAP_SERVER_URI = env.str('AUTH_LDAP_SERVER_URI', None)
AUTH_LDAP_BIND_DN = env.str('AUTH_LDAP_BIND_DN', None)
AUTH_LDAP_BIND_PASSWORD = env.str('AUTH_LDAP_BIND_PASSWORD', None)
AUTH_LDAP_CONNECTION_OPTIONS = LDAP_DEFAULT_CONN_OPTIONS
AUTH_LDAP_USER_SEARCH = LDAPSearch(
    env.str('AUTH_LDAP_USER_SEARCH_BASE', None),
    ldap.SCOPE_SUBTREE,
   LDAP_DEFAULT_FILTERSTR,
)
AUTH_LDAP_USER_ATTR_MAP = LDAP_DEFAULT_ATTR_MAP
AUTH_LDAP_USERNAME_DOMAIN = env.str('AUTH_LDAP_USERNAME_DOMAIN', None)
AUTH_LDAP_DOMAIN_PRINTABLE = env.str(
    'AUTH_LDAP_DOMAIN_PRINTABLE', AUTH_LDAP_USERNAME_DOMAIN
)
AUTHENTICATION_BACKENDS = tuple(
    itertools.chain(
        ('projectroles.auth_backends.PrimaryLDAPBackend',),
        AUTHENTICATION BACKENDS.
    )
)
# Secondary LDAP server (optional)
if ENABLE_LDAP_SECONDARY:
    AUTH_LDAP2_SERVER_URI = env.str('AUTH_LDAP2_SERVER_URI', None)
    AUTH_LDAP2_BIND_DN = env.str('AUTH_LDAP2_BIND_DN', None)
    AUTH_LDAP2_BIND_PASSWORD = env.str('AUTH_LDAP2_BIND_PASSWORD', None)
    AUTH_LDAP2_CONNECTION_OPTIONS = LDAP_DEFAULT_CONN_OPTIONS
    AUTH_LDAP2_USER_SEARCH = LDAPSearch(
        env.str('AUTH_LDAP2_USER_SEARCH_BASE', None),
        ldap.SCOPE_SUBTREE,
        LDAP_DEFAULT_FILTERSTR,
    )
    AUTH_LDAP2_USER_ATTR_MAP = LDAP_DEFAULT_ATTR_MAP
    AUTH LDAP2 USERNAME DOMAIN = env.str('AUTH LDAP2 USERNAME DOMAIN')
    AUTH_LDAP2_DOMAIN_PRINTABLE = env.str(
        'AUTH_LDAP2_DOMAIN_PRINTABLE', AUTH_LDAP2_USERNAME_DOMAIN
```

(continued from previous page)

```
)
AUTHENTICATION_BACKENDS = tuple(
    itertools.chain(
        ('projectroles.auth_backends.SecondaryLDAPBackend',),
        AUTHENTICATION_BACKENDS,
    )
)
```

SAML SSO Configuration (Optional)

Optional Single Sign-On (SSO) authorization via SAML is also available. To enable this feature, set ENABLE_SAML=1 in your environment. Configuring SAML for SSO requires proper configuration of the Keycloak SSO server and the SAML client library.

Keycloak

Create a new client in Keycloak and configure it as follows. Please note that **Client ID** can be chosen however you like, but it must match the setting in the client.

To generate the metadata.xml file required for the client, go to the **Realm Settings** page and in the **General** tab, click SAML 2.0 Identity Provider Metadata to download the xml data. Save it somewhere on the client, the preferred name is metadata.xml.

For the signing of the request send to the Keycloak server you will require a certificate and key provided by the Keycloak server and incorporated into the configuration of the client. Switch to the SAML Keys. Make sure to select PKCS12 as **Archive Format**.

Convert the archive on the commandline with the follow command and store them in some place on your client.

```
openssl pkcs12 -in keystore.p12 -password "pass:<PASSWORD>" -nodes | openssl x509 -out_

→cert.pem

openssl pkcs12 -in keystore.p12 -password "pass:<PASSWORD>" -nodes -nocerts | openssl_

→rsa -out key.pem
```

SODAR Core

Make sure that your config/settings/base.py contains the following configuration:

```
ENABLE_SAML = env.bool('ENABLE_SAML', False)
SAML2_AUTH = {
    # Required setting
    # Pysaml2 Saml client settings
    # See: https://pysaml2.readthedocs.io/en/latest/howto/config.html
    'SAML_CLIENT_SETTINGS': {
        # Optional entity ID string to be passed in the 'Issuer' element of
        # authn request, if required by the IDP.
        'entityid': env.str('SAML_CLIENT_ENTITY_ID', 'SODARcore'),
        'entitybaseurl': env.str(
            'SAML_CLIENT_ENTITY_URL', 'https://localhost:8000'
```

#
      }
# ).
# 'TRIGGER': {
#
      'FIND_USER': 'path.to.your.find.user.hook.method',
```

(continued from previous page)

Add the following settings to your environment variables:

```
ENABLE_SAML=1

SAML_CLIENT_ENTITY_ID=<Entity ID configured in Keycloak>

SAML_CLIENT_ENTITY_URL=<Client URL, e.g. https://sodar-core.bihealth.org>

SAML_CLIENT_METADATA_FILE=<e.g. metadata.xml>

SAML_CLIENT_IPO=<SSO server URL, e.g. https://sso.hpc.bihealth.org/auth/realms/cubi>

SAML_CLIENT_KEY_FILE=<e.g. key.pem>

SAML_CLIENT_CERT_FILE=<e.g. cert.pem>

SAML_CLIENT_XMLSEC1=<e.g. /usr/bin/xmlsec1>
```

Global JS/CSS Include Modifications (Optional)

It is possible to supplement (or replace, see below) global Javascript and CSS includes of your SODAR Core site without altering the base template. You can place a list of custom includes into the list variables PROJECTROLES_CUSTOM_JS_INCLUDES and PROJECTROLES_CUSTOM_CSS_INCLUDES. These can either be local static file paths or web URLs to e.g. CDN served files.

If using the default CDN imports for JQuery, Bootstrap4 etc. are not an optimal solution in your use case due to e.g. network issues, you can disable these includes by setting PROJECTROLES_DISABLE_CDN_INCLUDES to True.

Warning: If disabling the default CDN includes, you **must** provide replacements for **all** disabled files in your custom includes. Otherwise your SODAR Core based site will not function correctly!

Example:

}

```
PROJECTROLES_DISABLE_CDN_INCLUDES = True
PROJECTROLES_CUSTOM_JS_INCLUDES = [
   STATIC_ROOT + '/your/path/jquery-3.3.1.min.js',
   STATIC_ROOT + '/your/path/popper.min.js',
   'https://some-cdn.com/bootstrap.min.js',
   # ...
]
PROJECTROLES_CUSTOM_CSS_INCLUDES = [
   STATIC_ROOT + '/your/path/bootstrap.min.css',
   # ...
]
```

It is also possible to define inline HTML in an environment variable and include it in the head tag of the base template. To use this feature, add HTML script as the value of the variable PROJECTROLES_INLINE_HEAD_INCLUDE.

Example:

PROJECTROLES_INLINE_HEAD_INCLUDE="<meta name=\"keywords\" content=\"SODAR Core\">"

Warning: Make sure you are inputting valid HTML or you risk breaking the HTML on **all** pages of your SODAR Core based site!

Modifying SODAR_CONSTANTS (Optional)

String identifiers used globally in SODAR project management are defined in the SODAR_CONSTANTS dictionary. It can be imported into your app code with the import:

from projectroles.models import SODAR_CONSTANTS

If you need to update or extend the constants for use your site, you can import the default dictionary into your Django settings and modify it as necessary with the following snippet:

```
from projectroles.constants import get_sodar_constants
SODAR_CONSTANTS = get_sodar_constants(default=True)
# Your changes here..
```

Warning: Modifying existing default constants may result in unwanted issues, especially on a site which already contains created projects. Proceed with caution!

Logging (Optional)

It is recommended to add "projectroles" under LOGGING['loggers']. For production, ERROR debug level is recommended.

The example site and SODAR Django Site template provide the LOGGING_APPS and LOGGING_FILE_PATH helpers for easily adding SODAR Core apps to logging and providing a system path for optional log file writing.

If you are using ManagementCommandLogger for logging your management command output, you can disable redundant console input in e.g. your test configuration by setting LOGGING_DISABLE_CMD_OUTPUT to True.

5.6.4 Projectroles Usage

This document provides instructions for using the projectroles app which has been integrated into your Django site.

Hint: Detailed instructions for many pages can be found in an interactive tour by clicking the "Help" link in the right side of the top navigation bar.

Before reading this document, be sure to see *Projectroles Basics* for basic concepts regarding the use of this app.

Logging In

Unless anonymous access is specifically set on the site, apart from specific public or token-enabled views, user login is **mandatory** for using a SODAR Core based Django site.

One can either log in using a local Django user or, if LDAP/AD is enabled, their LDAP/AD credentials from a supported site. In the latter case, the user domain must be appended to the user name in form of user@DOMAIN. Single sign-on with SAML can also be made available.

Login Please log in.

password	
	된 Login

Fig. 6: SODAR login form

User Interface

Basics

Upon loggin into a SODAR Core based Django site using default templates and CSS, the general view of your site is split into the following elements:

- **Top navigation bar**: Contains the site logo and title, search element, link to advanced search, help link and the user dropdown menu.
- User dropown menu: Contains links to user management, admin site and site-wide apps the user has access to.
- Project sidebar: Shortcuts to project apps and project management pages
- **Project navigation**: Project structure breadcrumb (disabled for site apps)
- Content: Actual app content goes in this element
- Footer: Optional footer with e.g. site info and version

Home View

As content within a SODAR Core based site is by default sorted into projects, the home view displays a tree view of categories and projects to choose from. You can filter the list with a search term or restrict display to your starred projects.

🖞 SODA	AR Core Example Site Beta	🕸 5 alerts 🗙 😪	Search term	Search	Extra Link	: 🔀 Help 🚨 👻

	Public Subcategory					N/A
	Public Subproject S				0 0	Guest
	Test Project *				0 5	Contributor

Fig. 7: Home view

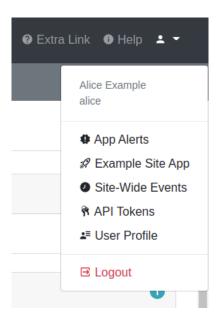

Fig. 8: User dropdown

Project Detail View

The project detail page dynamically imports elements from installed project apps, usually showing e.g. overview of latest additions to app data, statistics and/or shortcuts to app functionalities. Here you can also access project apps from the project sidebar. For project apps, the sidebar link leads to the app entry point view as defined in the app plugin.

For each page in a project app which extends the default projectroles template layout, the **project title bar** is displayed on the top of the page. This contains the project title and description and a link to "star" the project into your favourites. Below this, the **project app title bar** with possible app-specific controls is usually displayed.

Category and Project Management

In SODAR based sites, data is split into **categories** and **projects**. Categories may be freely nested and are used as containers of projects. They may contain a description and readme, but project apps are disabled for categories unless explicitly enabled. Projects can not be nested within each other.

Creating a Top Level Category

Currently, only users with a superuser status can create a top level category. This can be done by navigating to the *home view* and clicking the **Create Category** link. To create a category, a name and owner must be supplied, along with optional description and/or a readme document. All of these may be modified later.

Note: Currently, only users already previously logged into the system can be added as the owner of a category or project. The ability to invite users not yet on the site as owners will be added later.

Hint: When setting up a new site, think about what kind of category and project structure makes sense for your team and organization. Moving projects and categories under different categories is possible, but is not recommended and can currently only be done via the admin view or directly in the Django shell.

🖞 SOD	AR Core Example Site Beta Search term Search @ Extra Link • Help 🔹 👻

	README (optional, supports markdown)
	Public guest access Allow public guest access for the project, also including unauthenticated users if allowed on the site

Fig. 10: Category/project creation form

Creating Projects

Once navigating into a category, a user with sufficient access will see the **Create Project or Category** link in the side bar. This opens up a form for adding a project or a nested category under the current category. The form is identical to top level category creation, except that you can also choose between creating a project or a category.

Users with the role of *project contributor* or higher in a category are allowed to create a project within that category.

Updating Projects

An existing project or category can be updated from the **Update Project/Category** link in the side bar. Again, a similar form as before will be presented to the user. The owner can not be changed here, but must be modified in the *Members* view instead. It is possible to move the current category or project under another category by altering the parent field. The user who does the updating must have a sufficient role in the target category or superuser status.

Update Project	## TODO * Add readme here					
	* Update documentation screenshots					

Fig. 11: Category/project updating form

Note: For remote project synchronized from another SODAR Core based site, you can only edit local application settings in this view.

Public Guest Access

From the project create/update view, setting *Public Guest Access* will give everyone in the system read-only guest access in the project without specifically granting it.

Warning: If the site has been configured to allow in anonymous users, this will also make the project available to anyone who can access the site in your network! Please use this feature carefully.

App Settings

Project and site apps may define *app settings*, which can be either be set with the scope of *project*, *user* or *user within a project*.

Widgets for project specific settings will show up in the project creation and updating form and can only be modified by users with sufficient project access. User specific settings will be displayed in the *Userpforile app*.

By defining the attribute user_modifiable=False, project or user app settings will not be shown in the respective project/user update views. This is used e.g. in cases where a project app provides its own UI or updates some "hidden" setting due to user actions. Superusers will still see these hidden settings in the Update Project view.

Settings with the scope of user within a project do not currently have a separate UI of their own. Instead, project apps can produce their own user specific UIs for this functionality if manual user selection is needed.

Note: Currently, project specific app settings are also enabled for categories but do not actually do anything. The behaviour regarding this (remove settings / inherit by nested projects / etc) is TBD.

The projectroles app provides the following built-in app settings with the project scope:

- ip_restrict: Restict project access by an allowed IP list if enabled.
- ip_allowlist: List of allowed IP addresses for project access.

To clean up settings which have been stored in the database but have since been removed from the plugin app settings definitions, run the following management command:

\$./manage.py cleanappsettings

Member Management

Project member roles can be viewed and modified through the **Members** link on the sidebar. Modification requires a sufficient role in the project or category (owner or delegate) or superuser status.

Note: Owners of categories automatically inherit owner rights to projects placed under those categories, starting in SODAR Core v0.8.0. Adding separate roles for those users in the inherited projects is not allowed.

Note: At this time, category memberships are not automatically propagated to projects created under the category. An inheritance functionality may be implemented at a later date.

Example Project App										
2. <										

Adding Members

There are two ways to add new members to a project or a category:

- Add Member is used to add member roles to system users.
- Invite Member is used to send email invites to users not yet registered in the system.

Addition or modification of users sends an email notification to the user in question if email sending is enabled on your Django server. The emails can be previewed in corresponding forms.

Hint: As of SODAR Core v0.4.5, it is also possible to create an invite in the "add member" form. Inviting is enabled when inputting an email address not found among the system users.

Modifying Members

Changing or removing user roles can be done from links next to each role on the member list. Category or project ownership can be transferred to another user who currently has a role in the project by using the dropdown next to the owner role.

Invites

Invites are accepted by the responding user clicking on a link supplied in their invite email and either logging in to the site with their LDAP/AD credentials or creating a local user. The latter is only allowed if local users are enabled in the site's Django settings and the user email domain is not associated with configured LDAP domains. Invites expire after a certain time and can be reissued or revoked on the **Project Invites** page.

Batch Member Modifications

Batch member updates can be done either by using REST API views with appropriate project permissions, or by a site admin using the batchupdateroles management command. The latter supports multiple projects in one batch. It is also able to send invites to users who have not yet signed up on the site.

Remote Projects

It is possible to sync project metadata and member roles between multiple SODAR Core based Django sites. Remote sites and access can be managed in the **Remote Site Access** site app, found in the user dropdown menu in the top navigation bar.

Alternatively, remote sites can be created using the following management command:

\$./manage.py addremotesite

In the current implementation, your django site must either be in **source** or **target** mode. A source site can define one or multiple target sites where project data can be provided. A target site can define exactly one source site, from which project data can be retrieved from.

Note: These are arbitrary restrictions which may be relaxed in the future, if use cases warrant it.

To enable remote project data reading, you must first set up either a target or a source site depending on the role of your own SODAR site.

	Your site is	in SOURCE mode.		

Fig. 13: Remote site list in source mode

As Source Site

Navigate to the **Remote Site Access** site app and click on the *Add Target Site* link. You will be provided with a form for specifying the remote site. A secret string is generated automatically and you need to provide this to the administrator of the target site in question for accessing your site.

Here you also have the option to hide the remote project link from your users. Users viewing the project on the source site then won't see a link to the target site. Owners and Superusers will still see the link (greyed out). This is most commonly used for internal test sites which only needs to be used by admins.

Once created, you can access the list of projects on your site in regards to the created target site. For each project, you may select an access level, of which three are currently implemented:

- No access: No access on the remote site (default)
- **Read roles**: This allows for the target site to read project metadata *and* user roles in order to synchronize project access remotely.
- **Revoked access**: Previously available access which has been revoked. The project will still remain in the target site, but only superusers, the project owner or the project delegate(s) can acesss it.

Note: The *read roles* access level also provides metadata of the categories above the selected project so that the project structure can be maintained.

Note: Only LDAP/AD user roles and local administrator *owner* roles are provided to the target site. Other local user roles are ignored.

Note: Access levels for purely checking the existence of the project and only reading project metadata (title, description..) without member roles are implemented in the data model and backend, but currently disabled in the UI.

Once desired access to specific projects has been granted and confirmed, the target site will sync the data by sending a request to the source site.

	Test Category / Test Project		Never		No access	~
					🖋 Update P	roject Access

Fig. 14: Remote project list in source mode

As Target Site

The source site should be set up as above using the *Set Source Site* link, using the provided secret string as the access token.

After creating the source site, remote project metadata and member roles (for which access has been granted) can be accessed using the *Synchronize* link. Additionaly if the remote Source site is synchronized with multiple Target Sites, information about those other Target sites will be synchronized as well an displayed as *Peer Sites*.

Alternatively, the following management command can be used:

\$./manage.py syncremote

Note: Creating local projects under a category synchronized from a remote source site is **not** allowed from v0.8.3 onwards. For having local projects on a target site, you should create and use a local root category.

Note: If a local user is the owner of a synchronized project on the source site, the user defined in the PROJECTROLES_DEFAULT_ADMIN will be given the owner role. Hence you **must** have this setting defined if you are implementing a SODAR site in target mode.

Search

The basic search form is displayed in the top navigation bar if enabled. It takes one string as a search parameter, followed by optional keyword argument. At this time, the keyword of type has been implemented, used to limit the search to a certain data type as specified in app plugins.

Left to the basic search form is a link to the *Advanced Search* page, where you can currently search for items using multiple search terms combined with the OR operator.

Search results are split into results from different apps. For example, entering test will return all objects from all apps containing this string. Alternatively, entering test type:project will provide results from any app configured to produce results of type *project*. By default, this will result in the projectroles app listing projects which contain the search string in their name and/or description.

Note: Additional features such as full-text search and more keywords/operators will be defined in the future.

REST API

Several SODAR Core functionalities are also available via a HTTP REST API starting in version 0.8. See *Projectroles REST API Documentation* for instructions on REST API usage.

5.6.5 Projectroles Customization

Here you can find some customization instructions and tips for projectroles and SODAR Core.

CSS Overrides

If some of the CSS definitions in {STATIC}/projectroles/css/projectroles.css do not suit your purposes, it is possible to override them in your own includes. It is still recommended to include the "*Flexbox page setup*" section as provided.

In this chapter are examples of overrides you can place e.g. in project.css to change certain defaults.

Hint: While not explicitly mentioned, some parameters may require the !important argument to take effect on your site.

Warning: In the future we may instead offer a full Bootstrap 4 theme, which may deprecate current overriding/extending CSS classes.

Static Element Coloring

If you wish to recolor the background of the static elements on the page (title bar, side bar and project navigation breadcrumb), add the following CSS overrides.

```
.sodar-base-navbar, .sodar-pr-sidebar, .sodar-pr-sidebar-nav {
   background-color: #ff00ff;
}
.sodar-pr-navbar {
   background-color: #00ff00;
}
```

Sidebar Width

If the sidebar is not wide enough for your liking or e.g. a name of an app overflowing, the sidebar can be resized with the following override:

```
.sodar-pr-sidebar {
    width: 120px;
}
```

Title Bar

You can implement your own title bar by replacing the default base.html include of projectroles/______site_titlebar.html with your own HTML or include.

When doing this, it is possible to include elements from the default title bar separately:

- Search form: projectroles/_site_titlebar_search.html
- Site app and user operation dropdown: projectroles/_site_titlebar_dropdown.html

See the templates themselves for further instructions.

Additional Title Bar Links

If you want to add additional links *not* related to apps in the title bar, you can implement in the template file {SITE_NAME}/templates/include/_titlebar_nav.html. This can be done for e.g. documentation links or linking to external sites. Example:

Extra Login View Content

If you want to provide extra content in your site's login view, you can add custom HTML into the template file {SITE_NAME}/templates/include/_login_extend.html. The content will appear below the login form and its format is not restricted.

Site Logo

An optional site logo can be placed into {STATIC}/images/logo_navbar.png to be displayed in the default Projectroles title bar.

Custom Icon Collections

To use icons other than the default Material Design Icons collection, download the corresponding collection JSON file from the Iconify JSON repository into *{SITE_NAME}/static/iconify/json*. After that run *collectstatic* and the icons will be available using the collection identifier.

Project Breadcrumb

To add custom content in the end of the default project breadcrumb, use {% block nav_sub_project_extend %} in your app template.

The entire breadcrumb element can be overridden by declaring {% block nav_sub_project %} block in your app template.

Footer

Footer content can be specified in the optional template file {SITE_NAME}/templates/include/_footer.html.

Project and Category Display Names

If the *project* and *category* labels don't match your use case, it is possible to change the labels displayed to the user by editing SODAR_CONSTANTS in your Django site settings file. Example:

```
SODAR_CONSTANTS = get_sodar_constants(default=True)
SODAR_CONSTANTS['DISPLAY_NAMES']['CATEGORY'] = {
    'default': 'not-a-category',
    'plural': 'non-categories',
}
SODAR_CONSTANTS['DISPLAY_NAMES']['PROJECT'] = {
    'default': 'not-a-project',
    'plural': 'non-projects',
}
```

See more about overriding SODAR_CONSTANTS here.

To print out these values in your views or templates, call the get_display_name() function, which is available both as a template tag through projectroles_common_tags.py and a general utility function in utils.py. Capitalization and pluralization are handled by the function according to arguments. See the *Django API documentation* for details.

Note: These changes will not affect role names or IDs and descriptions of Timeline events.

5.6.6 Projectroles REST API Documentation

This document contains the HTTP REST API documentation for the projectroles app. The provided API enpoints allow project and role operations through HTTP API calls in addition to the GUI.

API Usage

Usage of the REST API is detailed in this section. These instructions also apply to REST APIs in any other application within SODAR Core and are recommended as guidelines for API development in your SODAR Core based Django site.

Authentication

The API supports authentication through Knox authentication tokens as well as logging in using your SODAR username and password. Tokens are the recommended method for security purposes.

For token access, first retrieve your token using the *Tokens App*. Add the token in the Authorization header of your HTTP request as follows:

Authorization: token 90c2483172515bc8f6d52fd608e5031db3fcdc06d5a83b24bec1688f39b72bcd

Versioning

The SODAR Core REST API uses accept header versioning. While specifying the desired API version in your HTTP requests is optional, it is **strongly recommended**. This ensures you will get the appropriate return data and avoid running into unexpected incompatibility issues.

To enable versioning, add the Accept header to your request with the following media type and version syntax. Replace the version number with your expected version.

Accept: application/vnd.bihealth.sodar-core+json; version=0.9.1

Note: The media type and version for internal SODAR Core apps are by design intended to be different to applications implemented in your Django site. Only use the aforementioned values when calling REST API views in projectroles or other applications installed from the django-sodar-core package.

Model Access and Permissions

Objects in SODAR Core API views are accessed through their sodar_uuid field. This is strongly recommended for views implemented in your Django site as well, as using a field such as pk may reveal internal database details to users as well as be incompatible if e.g. mirroring roles between multiple SODAR Core sites.

In the remainder of this document and other REST API documentation, "UUID" refers to the sodar_uuid field of each model unless otherwise noted.

For permissions the API uses the same rules which are in effect in the SODAR Core GUI. That means you need to have appropriate project access for each operation.

Project Type Restriction

IF you want to explicitly restrict access for your API view to a specific project type, you can set the project_type attribute of your class to either PROJECT_TYPE_PROJECT or PROJECT_TYPE_CATEGORY as defined in SODAR_CONSTANTS. A request to the view using the wrong project type will result in a 403 Not Authorized response, with the reason displayed in the detail view.

This works with any API view using SODARAPIProjectPermission as its permission class, which includes SODARAPIBaseProjectMixin and SODARAPIGenericProjectMixin. An example is shown below.

```
from rest_framework.generics import RetrieveAPIView
from projectroles.models import SODAR_CONSTANTS
from projectroles.views_api import CoreAPIGenericProjectMixin
class YourAPIView(SODARAPIGenericProjectMixin, RetrieveAPIView):
    # ...
project_type = SODAR_CONSTANTS['PROJECT_TYPE_PROJECT']
```

Return Data

The return data for each request will be a JSON document unless otherwise specified.

If return data is not specified in the documentation of an API view, it will return the appropriate HTTP status code along with an optional detail JSON field upon a successfully processed request.

For creation views, the sodar_uuid of the created object is returned along with other object fields.

API Views

```
class projectroles.views_api.ProjectListAPIView(**kwargs)
```

List all projects and categories for which the requesting user has access.

URL:/project/api/list

Methods: GET

Returns: List of project details (see ProjectRetrieveAPIView)

class projectroles.views_api.ProjectRetrieveAPIView(**kwargs)

Retrieve a project or category by its UUID.

URL:/project/api/retrieve/{Project.sodar_uuid}

Methods: GET

Returns:

- description: Project description (string)
- parent: Parent category UUID (string or null)
- readme: Project readme (string, supports markdown)
- public_guest_access: Guest access for all users (boolean)
- roles: Project role assignments (dict, assignment UUID as key)
- sodar_uuid: Project UUID (string)
- title: Project title (string)
- type: Project type (string, options: PROJECT or CATEGORY)

class projectroles.views_api.ProjectCreateAPIView(**kwargs)

Create a project or a category.

URL:/project/api/create

Methods: POST

Parameters:

- title: Project title (string)
- type: Project type (string, options: PROJECT or CATEGORY)
- parent: Parent category UUID (string)
- description: Project description (string, optional)
- readme: Project readme (string, optional, supports markdown)
- public_guest_access: Guest access for all users (boolean)
- owner: User UUID of the project owner (string)

class projectroles.views_api.ProjectUpdateAPIView(**kwargs)

Update the metadata of a project or a category.

Note that the project owner can not be updated here. Instead, use the dedicated API view RoleAssignmentOwnerTransferAPIView.

The project type can not be updated once a project has been created. The parameter is still required for non-partial updates via the PUT method.

URL:/project/api/update/{Project.sodar_uuid}

Methods: PUT, PATCH

Parameters:

- title: Project title (string)
- type: Project type (string, can not be modified)
- parent: Parent category UUID (string)
- description: Project description (string, optional)
- readme: Project readme (string, optional, supports markdown)
- public_guest_access: Guest access for all users (boolean)

class projectroles.views_api.RoleAssignmentCreateAPIView(**kwargs)

Create a role assignment in a project.

URL:/project/api/roles/create/{Project.sodar_uuid}

Methods: POST

Parameters:

- role: Desired role for user (string, e.g. "project contributor")
- user: User UUID (string)

class projectroles.views_api.RoleAssignmentUpdateAPIView(**kwargs)

Update the role assignment for a user in a project.

The user can not be changed in this API view.

URL: /project/api/roles/update/{RoleAssignment.sodar_uuid}

Methods: PUT, PATCH

Parameters:

- role: Desired role for user (string, e.g. "project contributor")
- user: User UUID (string)

class projectroles.views_api.RoleAssignmentDestroyAPIView(**kwargs)

Destroy a role assignment.

The owner role can not be destroyed using this view.

URL: /project/api/roles/destroy/{RoleAssignment.sodar_uuid}

Methods: DELETE

class projectroles.views_api.RoleAssignmentOwnerTransferAPIView(**kwargs)

Trensfer project ownership to another user with a role in the project. Reassign a different role to the previous owner.

The new owner must already have a role assigned in the project.

URL: /project/api/roles/owner-transfer/{Project.sodar_uuid}

Methods: POST

Parameters:

- new_owner: User name of new owner (string)
- old_owner_role: Role for old owner (string. e.g. "project delegate")

class projectroles.views_api.ProjectInviteListAPIView(**kwargs)

List user invites for a project.

URL:/project/api/invites/list/{Project.sodar_uuid}

Methods: GET

Returns: List of project invite details

class projectroles.views_api.ProjectInviteCreateAPIView(**kwargs) Create a project invite. URL: /project/api/invites/create/{Project.sodar_uuid} Methods: POST **Parameters:** • email: User email (string) • role: Desired role for user (string, e.g. "project contributor") class projectroles.views_api.ProjectInviteRevokeAPIView(**kwargs) Revoke a project invite. URL: /project/api/invites/revoke/{ProjectInvite.sodar_uuid} Methods: POST class projectroles.views_api.ProjectInviteResendAPIView(**kwargs) Resend email for a project invite. URL: /project/api/invites/resend/{ProjectInvite.sodar_uuid} Methods: POST class projectroles.views_api.UserListAPIView(**kwargs) List users in the system. URL: /project/api/users/list Methods: GET **Returns**: For each user: • email: Email address of the user (string) • name: Full name of the user (string) • sodar_uuid: User UUID (string) • username: Username of the user (string) class projectroles.views_api.CurrentUserRetrieveAPIView(**kwargs) Return information on the user making the request. URL: /project/api/users/current Methods: GET **Returns**: For current user: • email: Email address of the user (string)

- name: Full name of the user (string)
- sodar_uuid: User UUID (string)
- username: Username of the user (string)

5.6.7 Projectroles Django API Documentation

This document contains the Django API documentation for the projectroles app. Included are functionalities and classes intended to be used by other applications when building a SODAR Core based Django site.

Plugins

SODAR plugin point definitions and helper functions for plugin retrieval are detailed in this section.

Plugin point definitions and plugin API for apps based on projectroles

class projectroles.plugins.BackendPluginPoint

Projectroles plugin point for registering backend apps

get_api()

Return API entry point object.

get_extra_data_link(_extra_data, _name)

Return a link for timeline label starting with 'extra-'

get_object(model, uuid)

Return object based on a model class and the object's SODAR UUID.

Parameters

• model - Object model class

• uuid - sodar_uuid of the referred object

Returns

Model object or None if not found

Raise

NameError if model is not found

get_object_link(model_str, uuid)

Return URL referring to an object used by the app, along with a label to be shown to the user for linking.

Parameters

- model_str Object class (string)
- **uuid** sodar_uuid of the referred object

Returns

Dict or None if not found

get_statistics()

Return backend statistics as a dict. Should take the form of {id: {label, value, url (optional), description (optional)}}.

Returns

Dict

class projectroles.plugins.ProjectAppPluginPoint

Projectroles plugin point for registering project specific apps

get_extra_data_link(_extra_data, _name)

Return a link for timeline label starting with 'extra-'

get_object(model, uuid)

Return object based on a model class and the object's SODAR UUID.

Parameters

- model Object model class
- uuid sodar_uuid of the referred object

Returns

Model object or None if not found

Raise

NameError if model is not found

get_object_link(model_str, uuid)

Return URL referring to an object used by the app, along with a label to be shown to the user for linking.

Parameters

• model_str - Object class (string)

• uuid – sodar_uuid of the referred object

Returns

Dict or None if not found

get_project_list_value(column_id, project, user)

Return a value for the optional additional project list column specific to a project.

Parameters

- column_id ID of the column (string)
- **project** Project object
- **user** User object (current user)

Returns

String (may contain HTML), integer or None

get_statistics()

Return app statistics as a dict. Should take the form of {id: {label, value, url (optional), description (optional)}}.

Returns

Dict

search(search_terms, user, search_type=None, keywords=None)

Return app items based on one or more search terms, user, optional type and optional keywords.

Parameters

- search_terms Search terms to be joined with the OR operator (list of strings)
- **user** User object for user initiating the search
- search_type String
- keywords List (optional)

Returns

Dict

update_cache(name=None, project=None, user=None)

Update cached data for this app, limitable to item ID and/or project.

Parameters

- **name** Item name to limit update to (string, optional)
- project Project object to limit update to (optional)
- **user** User object to denote user triggering the update (optional)

urls = []

App URLs (will be included in settings by djangoplugins)

class projectroles.plugins.ProjectModifyPluginMixin

Mixin for project plugin API extensions for additional actions to be performed for project and role modifications. Used if e.g. updating external resources based on SODAR Core projects.

Add this into your project app or backend plugin if you want to implement additional modification features. It is not supported on site app plugins.

perform_owner_transfer(*project*, *new_owner*, *old_owner*, *old_owner_role*, *request=None*)

Perform additional actions to finalize project ownership transfer.

Parameters

- project Project object
- new_owner SODARUser object for new owner
- old_owner SODARUser object for previous owner
- old_owner_role Role object for new role of previous owner
- request Request object or None

Perform additional actions to finalize project creation or update.

Parameters

- project Current project object (Project)
- **action** Action to perform (CREATE or UPDATE)
- project_settings Project app settings (dict)
- **old_data** Old project data in case of an update (dict or None)
- old_settings Old app settings in case of update (dict or None)
- request Request object or None

perform_project_sync(project)

Synchronize existing projects to ensure related data exists when the syncmodifyapi management comment is called. Should mostly be used in development when the development databases have been e.g. modified or recreated.

Parameters

project - Current project object (Project)

perform_role_delete(role_as, request=None)

Perform additional actions to finalize role assignment deletion.

Parameters

- role_as RoleAssignment object
- request Request object or None

perform_role_modify(role_as, action, old_role=None, request=None)

Perform additional actions to finalize role assignment creation or update.

Parameters

- role_as RoleAssignment object
- action Action to perform (CREATE or UPDATE)
- old_role Role object for previous role in case of an update
- request Request object or None

revert_owner_transfer(project, new_owner, old_owner, old_owner_role, request=None)

Revert project ownership transfer if errors have occurred in other apps.

Parameters

- **project** Project object
- new_owner SODARUser object for new owner
- old_owner SODARUser object for previous owner
- old_owner_role Role object for new role of previous owner
- request Request object or None

Revert project creation or update if errors have occurred in other apps.

Parameters

- project Current project object (Project)
- action Action which was performed (CREATE or UPDATE)
- project_settings Project app settings (dict)
- **old_data** Old project data in case of update (dict or None)
- **old_settings** Old app settings in case of update (dict or None)
- request Request object or None

revert_role_delete(role_as, request=None)

Revert role assignment deletion deletion if errors have occurred in other apps.

Parameters

- role_as RoleAssignment object
- request Request object or None

```
revert_role_modify(role_as, action, old_role=None, request=None)
```

Revert role assignment creation or update if errors have occurred in other apps.

Parameters

- role_as RoleAssignment object
- action Action which was performed (CREATE or UPDATE)
- old_role Role object for previous role in case of an update
- request Request object or None

class projectroles.plugins.RemoteSiteAppPlugin

Site plugin for remote site and project management

app_permission = 'userprofile.update_remote'

Required permission for displaying the app

description = 'Management of remote SODAR sites and remote project access'
 Description string

entry_point_url_id = 'projectroles:remote_sites'

Entry point URL ID

```
icon = 'mdi:cloud-sync'
```

Iconify icon

name = 'remotesites'

Name (slug-safe, used in URLs)

title = 'Remote Site Access'

Title (used in templates)

urls = []

App URLs (will be included in settings by djangoplugins)

class projectroles.plugins.SiteAppPluginPoint

Projectroles plugin point for registering site-wide apps

get_extra_data_link(_extra_data, _name)

Return a link for timeline label starting with 'extra-'

get_messages(user=None)

Return a list of messages to be shown to users.

Parameters

user – User object (optional)

Returns

List of dicts or and empty list if no messages

get_object(model, uuid)

Return object based on a model class and the object's SODAR UUID.

Parameters

- model Object model class
- uuid sodar_uuid of the referred object

Returns

Model object or None if not found

Raise

NameError if model is not found

get_object_link(model_str, uuid)

Return URL referring to an object used by the app, along with a label to be shown to the user for linking.

Parameters

• model_str - Object class (string)

• uuid - sodar_uuid of the referred object

Returns

Dict or None if not found

get_statistics()

Return app statistics as a dict. Should take the form of {id: {label, value, url (optional), description (optional)}}.

Returns

Dict

projectroles.plugins.change_plugin_status(name, status, plugin_type='app')

Change the status of a selected plugin in the database.

Parameters

- **name** Plugin name (string)
- **status** Status (int, see djangoplugins)
- plugin_type Type of plugin ("app", "backend" or "site")

Raise

ValueError if plugin_type is invalid or plugin with name not found

projectroles.plugins.get_active_plugins(plugin_type='project_app', custom_order=False)
Return active plugins of a specific type.

Parameters

- plugin_type "project_app", "site_app" or "backend" (string)
- **custom_order** Order by plugin_ordering for project apps (boolean)

Returns

List or None

Raise

ValueError if plugin_type is not recognized

projectroles.plugins.get_app_plugin(plugin_name, plugin_type=None)

Return active app plugin.

Parameters

- **plugin_name** Plugin name (string)
- plugin_type Plugin type (string or None for all types)

Returns

Plugin object or None if not found

projectroles.plugins.get_backend_api(plugin_name, force=False, **kwargs)

Return backend API object. NOTE: May raise an exception from plugin.get_api().

Parameters

- plugin_name Plugin name (string)
- force Return plugin regardless of status in ENABLED_BACKEND_PLUGINS
- kwargs Optional kwargs for API

Returns

Plugin object or None if not found

Models

Projectroles models are used by other apps for project access and metadata management as well as linking objects to projects.

Models for the projectroles app

class projectroles.models.AppSetting(*args, **kwargs)

Project and users settings value.

The settings are defined in the "app_settings" member in a SODAR project app's plugin. The scope of each setting can be either "USER" or "PROJECT", defined for each setting in app_settings. Project AND user-specific settings or settings which don't belong to either are are currently not supported.

exception DoesNotExist

exception MultipleObjectsReturned

app_plugin

App to which the setting belongs

get_value()

Return value of the setting in the format specified in 'type'

name

Name of the setting

project

Project to which the setting belongs

save(*args, **kwargs)

Version of save() to convert 'value' data according to 'type'

sodar_uuid

AppSetting SODAR UUID

type

Type of the setting

user

Project to which the setting belongs

user_modifiable

Setting visibility in forms

value

Value of the setting

value_json

Optional JSON value for the setting

```
class projectroles.models.AppSettingManager(*args, **kwargs)
```

Manager for custom table-level AppSetting queries

get_setting_value(app_name, setting_name, project=None, user=None)

Return value of setting_name for app_name in project or for user.

Note that project and/or user must be set.

Parameters

- app_name App plugin name (string)
- setting_name Name of setting (string)
- project Project object or pk
- user User object or pk

Returns

Value (string)

Raise

AppSetting.DoesNotExist if setting is not found

class projectroles.models.Project(*args, **kwargs)

A SODAR project. Can have one parent category in case of nested projects. The project must be of a specific type, of which "CATEGORY" and "PROJECT" are currently implemented. "CATEGORY" projects are used as containers for other projects

exception DoesNotExist

exception MultipleObjectsReturned

description

Short project description

full_title

Full project title with parent path (auto-generated)

get_all_roles(inherited=True)

Return all RoleAssignments for the project, including inherited owner rights from parent categories.

Parameters

inherited – Include inherited owners (bool, default=True)

Returns List

get_children(flat=False)

Return child objects for the Project sorted by title.

Parameters

flat – Return all children recursively as a flat list (bool)

Returns

Iterable of Project

get_delegates(exclude_inherited=False)

Return RoleAssignments for delegates

get_depth()

Return depth of project in the project tree structure (root=0)

get_log_title()

Return a log title for the project

get_members()

Return RoleAssignments for members of project excluding owner and delegates.

get_owner()

Return RoleAssignment for owner (without inherited owners) or None if not set.

get_owners(inherited_only=False)

Return RoleAssignments for project owner as well as possible inherited owners from parent projects.

Parameters

inherited_only – Only show inherited owners if True (bool)

Returns

List

get_parents()

Return an array of parent projects in inheritance order

get_source_site()

Return source site or None if this is a locally defined project

has_public_children

Whether project has children with public access (auto-generated)

has_role(user, include_children=False, check_owner=True)

Return whether user has roles in Project. If include_children is True, return True if user has roles in ANY child project. Returns True if user inherits owner permissions from a parent category, or if public access is allowed for the project.

is_delegate(user)

Return True if user is delegate in this project.

is_owner(user)

Return True if user is owner in this project or inherits ownership from a parent category.

is_owner_or_delegate(user)

Return True if user is either an owner or a delegate in this project. Includes inherited owner relationships.

is_remote()

Return True if current project has been retrieved from a remote SODAR site.

is_revoked()

Return True if remote access has been revoked for the project

parent

Parent category if nested, otherwise null

public_guest_access

Public guest access

readme

Project README (optional, supports markdown)

save(*args, **kwargs)

Custom validation and field populating for Project

set_public(public=True)

Helper for setting value of public_guest_access

sodar_uuid

Project SODAR UUID

title

Project title

type

Type of project ("CATEGORY", "PROJECT")

class projectroles.models.ProjectInvite(*args, **kwargs)

Invite which is sent to a non-logged in user, determining their role in the project.

exception DoesNotExist

exception MultipleObjectsReturned

active

Status of the invite (False if claimed or revoked)

date_created

DateTime of invite creation

date_expire

Expiration of invite as DateTime

email

Email address of the person to be invited

issuer

User who issued the invite

message

Message to be included in the invite email (optional)

project

Project to which the person is invited

role

Role assigned to the person

secret

Secret token provided to user with the invite

sodar_uuid

ProjectInvite SODAR UUID

class projectroles.models.ProjectManager(*args, **kwargs)

Manager for custom table-level Project queries

find(search_terms, keywords=None, project_type=None)

Return projects with a partial match in full title or, including titles of parent Project objects, or the description of the current object. Restrict to project type if project_type is set.

Parameters

- search_terms Search terms (list)
- keywords Optional search keywords as key/value pairs (dict)
- project_type Project type or None

Returns

QuerySet of Project objects

class projectroles.models.ProjectUserTag(*args, **kwargs)

Tag assigned by a user to a project

exception DoesNotExist

exception MultipleObjectsReturned

name

Name of tag to be assigned

project

Project to which the tag is assigned

sodar_uuid

ProjectUserTag SODAR UUID

user

User for whom the tag is assigned

class projectroles.models.RemoteProject(*args, **kwargs)

Remote project relation

exception DoesNotExist

exception MultipleObjectsReturned

date_access

DateTime of last access from/to remote site

get_project()

Get the related Project object

level

Project access level

project

Related project object (if created locally)

project_uuid

Related project UUID

site

Related remote SODAR site

sodar_uuid

RemoteProject relation UUID (local)

class projectroles.models.RemoteSite(*args, **kwargs)

Remote SODAR site

exception DoesNotExist

exception MultipleObjectsReturned

description

Site description

get_access_date()

Return date of latest project access by remote site

get_url()

Return sanitized site URL

mode

Site mode

name

Site name

save(*args, **kwargs)

Version of save() to include custom validation

secret

Secret token used to connect to the master site

sodar_uuid

RemoteSite relation UUID (local)

url

Site URL

user_display

RemoteSite's link visibilty for users

class projectroles.models.Role(*args, **kwargs)

Role definition, used to assign roles to projects in RoleAssignment

exception DoesNotExist

exception MultipleObjectsReturned

description

Role description

name

Name of role

class projectroles.models.RoleAssignment(*args, **kwargs)

Assignment of an user to a role in a project. One role per user is allowed for each project. Roles of project owner and project delegate assignments might be limited (to PROJECTROLES_DELEGATE_LIMIT) per project.

exception DoesNotExist

exception MultipleObjectsReturned

project

Project in which role is assigned

role

Role to be assigned

save(*args, **kwargs)

Version of save() to include custom validation for RoleAssignment

sodar_uuid

RoleAssignment SODAR UUID

user

User for whom role is assigned

class projectroles.models.RoleAssignmentManager(*args, **kwargs)

Manager for custom table-level RoleAssignment queries

get_assignment(user, project)

Return assignment of user to project, or None if not found

class projectroles.models.SODARUser(*args, **kwargs)

SODAR compatible abstract user model. Use this on your SODAR Core based site.

get_full_name()

Return full name or username if not set

save(*args, **kwargs)

Save the current instance. Override this in a subclass if you want to control the saving process.

The 'force_insert' and 'force_update' parameters can be used to insist that the "save" must be an SQL insert or update (or equivalent for non-SQL backends), respectively. Normally, they should not be set.

set_group()

Set user group based on user name.

sodar_uuid

User SODAR UUID

projectroles.models.assign_user_group(sender, user, **kwargs)

Signal for user group assignment

projectroles.models.handle_ldap_login(sender, user, **kwargs)

Signal for LDAP login handling

App Settings

Projectroles provides an API for getting or setting project and user specific settings. The API can be invoked as follows:

```
from projectroles.app_settings import AppSettingAPI
app_settings = AppSettingAPI()
```

class projectroles.app_settings.AppSettingAPI

classmethod delete_setting(app_name, setting_name, project=None, user=None)

Delete app setting.

Parameters

- app_name App name (string, must equal "name" in app plugin)
- **setting_name** Setting name (string)
- **project** Project object to delete setting from (optional)
- **user** User object to delete setting from (optional)

classmethod get_all_defaults(scope, post_safe=False)

Get all default settings for a scope.

Parameters

- **scope** Setting scope (PROJECT, USER or PROJECT_USER)
- **post_safe** Whether POST safe values should be returned (bool)

Returns

Dict

classmethod get_all_defs()

Return app setting definitions for projectroles and all active app plugins in a dictionary with the app name as key.

Returns Dict

classmethod get_all_settings(project=None, user=None, post_safe=False)

Return all setting values. If the value is not found, return the default.

Parameters

- project Project object (optional)
- user User object (optional)
- **post_safe** Whether POST safe values should be returned (bool)

Returns

Dict

Raise

ValueError if neither project nor user are set

classmethod get_app_setting(*app_name*, *setting_name*, *project=None*, *user=None*, *post_safe=False*) Return app setting value for a project or an user. If not set, return default.

Parameters

- app_name App name (string, must equal "name" in app plugin)
- **setting_name** Setting name (string)
- project Project object (optional)
- user User object (optional)
- **post_safe** Whether a POST safe value should be returned (bool)

Returns

String or None

Raise

KeyError if nothing is found with setting_name

classmethod get_default_setting(app_name, setting_name, post_safe=False)

Get default setting value from an app plugin.

Parameters

- **app_name** App name (string, must equal "name" in app plugin)
- **setting_name** Setting name (string)
- **post_safe** Whether a POST safe value should be returned (bool)

Returns

Setting value (string, integer or boolean)

Raise

ValueError if app plugin is not found

Raise

KeyError if nothing is found with setting_name

classmethod get_projectroles_defs()

Return projectroles settings definitions. If it exists. get value from settings.PROJECTROLES_APP_SETTINGS_TEST for testing modifications.

Returns Dict

classmethod get_setting_def(name, plugin=None, app_name=None)

Return definition for a single app setting, either based on an app name or the plugin object.

Parameters

- name Setting name
- plugin Plugin object extending ProjectAppPluginPoint or None
- **app_name** Name of the app plugin (string or None)

Returns

Dict

Raise

ValueError if neither app_name or plugin are set or if setting is not found in plugin

classmethod get_setting_defs(scope, plugin=None, app_name=None, user_modifiable=False)

Return app setting definitions of a specific scope from a plugin.

Parameters

- scope PROJECT, USER or PROJECT_USER
- plugin Plugin object extending ProjectAppPluginPoint or None
- **app_name** Name of the app plugin (string or None)
- **user_modifiable** Only return modifiable settings if True (boolean)

Returns

Dict

Raise

ValueError if scope is invalid or if if neither app_name or plugin are set

Set value of an existing project or user settings. Creates the object if not found.

Parameters

- app_name App name (string, must equal "name" in app plugin)
- **setting_name** Setting name (string)
- value Value to be set
- project Project object (optional)
- **user** User object (optional)
- validate Validate value (bool, default=True)

Returns

True if changed, False if not changed

Raise

ValueError if validating and value is not accepted for setting type

Raise

ValueError if neither project nor user are set

Raise

KeyError if setting name is not found in plugin specification

classmethod validate_setting(setting_type, setting_value, setting_options)

Validate setting value according to its type.

Parameters

- **setting_type** Setting type
- setting_value Setting value
- **setting_options** Setting options (can be None)

Raise

ValueError if setting_type or setting_value is invalid

Common Template Tags

These tags can be included in templates with {% load projectroles_common_tags %}.

Template tags provided by projectroles for use in other apps

projectroles.templatetags.projectroles_common_tags.check_backend(*name*) Return True if backend app is available and enabled, else False

projectroles.templatetags.projectroles_common_tags.force_wrap(s, length)
Force wrapping of string

projectroles.templatetags.projectroles_common_tags.get_app_setting(app_name, setting_name,

project=None, user=None)

Get a project/user specific app setting from AppSettingAPI

Return import string for backend app Javascript or CSS. Returns empty string if not found.

Return display name from SODAR_CONSTANTS

Return value of Django setting by name or the default value if the setting is not found. Return a Javascript-safe value if js=True.

- projectroles.templatetags.projectroles_common_tags.get_full_url(request, url) Get full URL based on a local URL

Return link to project with a simple or full title

- projectroles.templatetags.projectroles_common_tags.get_project_title_html(project) Return HTML version of the full project title including parents
- projectroles.templatetags.projectroles_common_tags.get_remote_icon(project, request)
 Get remote project icon HTML
- projectroles.templatetags.projectroles_common_tags.get_role_display_name(*role_as, title=False*) Return display name for role assignment
- projectroles.templatetags.projectroles_common_tags.get_user_html(user) Return standard HTML representation for a User object
- projectroles.templatetags.projectroles_common_tags.get_visible_projects(projects,

can_view_hidden_projects=False)

Return all projects that are either visible by user display or by view hidden permission.

projectroles.templatetags.projectroles_common_tags.template_exists(path) Return True/False based on whether a template exists

Utilities

General utility functions are stored in utils.py.

projectroles.utils.build_invite_url(invite, request)

Return invite URL for a project invitation.

Parameters

- **invite** ProjectInvite object
- request HTTP request

Returns

URL (string)

projectroles.utils.build_secret(length=32)

Return secret string for e.g. public URLs.

Parameters

length – Length of string if specified, default value from settings

Returns

Randomized secret (string)

projectroles.utils.get_app_names()

Return list of names for locally installed non-django apps

projectroles.utils.get_display_name(key, title=False, count=1, plural=False) Return display name from SODAR_CONSTANTS.

Parameters

- **key** Key in SODAR_CONSTANTS['DISPLAY_NAMES'] to return (string)
- **title** Return name in title case if true (boolean, optional)
- count Item count for returning plural form, overrides plural=False if not 1 (int, optional)
- plural Return plural form if True, overrides count != 1 if True (boolean, optional)

Returns

String

projectroles.utils.get_expiry_date()

Return expiry date based on current date + INVITE_EXPIRY_DAYS

Returns

DateTime object

projectroles.utils.get_user_display_name(user, inc_user=False)

Return full name of user for displaying.

Parameters

- **user** User object
- **inc_user** Include user name if true (boolean)

Returns

String

Base REST API View Classes

Base view classes and mixins for building REST APIs can be found in projectroles.views_api.

Permissions / Versioning / Rendering

class projectroles.views_api.SODARAPIProjectPermission

Bases: ProjectAccessMixin, BasePermission

Mixin for providing a basic project permission checking for API views with a single permission_required attribute. Also works with Knox token based views.

This must be used in the permission_classes attribute in order for token authentication to work.

Requires implementing either permission_required or get_permission_required() in the view.

Project type can be restricted to PROJECT_TYPE_CATEGORY or PROJECT_TYPE_PROJECT by setting the project_type attribute in the view.

has_permission(request, view)

Override has_permission() for checking auth and project permission

class projectroles.views_api.SODARAPIVersioning

Bases: AcceptHeaderVersioning

Accept header versioning class for SODAR API views

class projectroles.views_api.SODARAPIRenderer

Bases: JSONRenderer

SODAR API JSON renderer with a site-specific media type retrieved from Django settings

Base API View Mixins

class projectroles.views_api.SODARAPIBaseMixin

Base SODAR API mixin to be used by external SODAR Core based sites

versioning_class

alias of SODARAPIVersioning

class projectroles.views_api.SODARAPIBaseProjectMixin

Bases: ProjectAccessMixin, SODARAPIBaseMixin

API view mixin for the base DRF APIView class with project permission checking, but without serializers and other generic view functionality.

Project type can be restricted to PROJECT_TYPE_CATEGORY or PROJECT_TYPE_PROJECT by setting the project_type attribute in the view.

class projectroles.views_api.APIProjectContextMixin

Bases: ProjectAccessMixin

Mixin to provide project context and queryset for generic API views. Can be used both in SODAR and SODAR Core API base views.

class projectroles.views_api.SODARAPIGenericProjectMixin

Bases: APIProjectContextMixin, SODARAPIBaseProjectMixin

API view mixin for generic DRF API views with serializers, SODAR project context and permission checkin.

Unless overriding permission_classes with their own implementation, the user MUST supply a permission_required attribute.

Replace lookup_url_kwarg with your view's url kwarg (SODAR project compatible model name in lowercase)

If the lookup is done via the project object, change lookup_field into "sodar_uuid"

class projectroles.views_api.ProjectQuerysetMixin

Mixin for overriding the default queryset with one which allows us to lookup a Project object directly.

Base Ajax API View Classes

Base view classes and mixins for building Ajax API views can be found in projectroles.views_ajax.

class projectroles.views_ajax.SODARBaseAjaxMixin

Bases: object

Base Ajax mixin with permission class retrieval. To be used if another base class instead of SODARBaseAjaxView is needed.

The allow_anonymous property can be used to control whether anonymous users should access an Ajax view when PROJECTROLES_ALLOW_ANONYMOUS==True.

class projectroles.views_ajax.SODARBaseAjaxView(**kwargs)

Bases: SODARBaseAjaxMixin, APIView

Base Ajax view with Django session authentication.

No permission classes or mixins used, you will have to supply your own if using this class directly.

class projectroles.views_ajax.SODARBasePermissionAjaxView(**kwargs)

Bases: PermissionRequiredMixin, SODARBaseAjaxView

Base Ajax view with permission checks, to be used e.g. in site apps with no project context.

User-based perms such as is_superuser can be used with this class.

handle_no_permission()

Override handle_no_permission() to provide 403

class projectroles.views_ajax.SODARBaseProjectAjaxView(**kwargs)

Bases: ProjectAccessMixin, SODARBaseAjaxView

Base Ajax view with SODAR project permission checks

Base Serializers

Base serializers for SODAR Core compatible models are available in projectroles.serializers.

class projectroles.serializers.SODARModelSerializer(*args, **kwargs)

Bases: ModelSerializer

Base serializer for any SODAR model with a sodar_uuid field

post_save(obj)

Function to call at the end of a custom save() method. Ensures the returning of sodar_uuid in object creation POST responses.

```
Parameters
obj – Object created in save()
```

Returns obj

save(**kwargs)

Override save() to ensure sodar_uuid is included for object creation POST responses.

to_representation(instance)

Override to_representation() to ensure sodar_uuid is included for object creation POST responses.

class projectroles.serializers.SODARProjectModelSerializer(*args, **kwargs)

Bases: SODARModelSerializer

Base serializer for SODAR models with a project relation.

The project field is read only because it is retrieved through the object reference in the URL.

create(validated_data)

Override create() to add project into validated data

to_representation(instance)

Override to_representation() to ensure the project value is included in responses.

class projectroles.serializers.SODARNestedListSerializer(*args, **kwargs)

Bases: SODARModelSerializer

Serializer to display nested SODAR models as dicts with sodar_uuid as key.

to_representation(instance)

Override to_representation() to pop project from a nested list representation, where the project context is already known in the topmost model.

class projectroles.serializers.SODARUserSerializer(*args, **kwargs)

Bases: SODARModelSerializer

Serializer for the user model used in SODAR Core based sites

5.7 Adminalerts App

The adminalerts site app enables system administrators to display site-wide messages to all users with an expiration date.

5.7.1 Basics

The app displays un-dismissable small alerts on the top of page content to all users. They can be used to e.g. warn users of upcoming downtime or highlight recently deployed changes.

Upon creation, an expiration date is set for each alert. Alerts can also be freely enabled, disabled or deleted by superuser on the app UI. Additional information regarding an alert can be provided with Markdown syntax and viewed on a separate details page.

5.7.2 Installation

Warning: To install this app you **must** have the django-sodar-core package installed and the projectroles app integrated into your Django site. See the *projectroles integration document* for instructions.

Django Settings

The adminalerts app is available for your Django site after installing django-sodar-core. Add the app into THIRD_PARTY_APPS as follows:

```
THIRD_PARTY_APPS = [
    # ...
    'adminalerts.apps.AdminalertsConfig',
]
```

Optional Settings

To alter default adminalerts app settings, insert the following **optional** variables with values of your choosing:

```
# Adminalerts app settings
ADMINALERTS_PAGINATION = 15  # Number of alerts to be shown on one page (int)
```

URL Configuration

In the Django URL configuration file, add the following line under urlpatterns to include adminalerts URLs in your site.

```
urlpatterns = [
    # ...
    url(r'^alerts/admin/', include('adminalerts.urls')),
]
```

Migrate Database and Register Plugin

To migrate the Django database and register the adminalerts site app plugin, run the following management command:

\$./manage.py migrate

In addition to the database migration operation, you should see the following output:

```
Registering Plugin for admimnalert.plugins.SiteAppPlugin
```

5.7.3 Usage

When logged in as a superuser, you can find the *Admin Alerts* option in your user dropdown menu in the top right corner of the site. This application is only available for users with superuser status.

The initial view displays a list of alerts along with their active/inactive status. For each alert there is a dropdown for updating or deleting the alert. The *Status* column active/inactive badge doubles as a button for toggling the alert status. Inactive alerts will not be shown to users.

Admin Alerts					+ Create Alert
Message	User	Created	Expiry	Status	
This is an active alert.	admin	2021-12-13 13:49:04	2021-12-18	ACTIVE	¢ -
This is an old and expired alert.	admin	2021-12-13 13:48:40	2021-12-14	INACTIVE	¢ -

To create a new alert, click the *Create Alert* button. This presents a simple form for creating a new alert. The following fields can be edited:

Message

The message displayed to users on any page of the site.

Expiry Date

The date when this alert will automatically expire and no longer be displayed.

Active

Flag for the current state of the alert. Alerts can be activated or inactivated at any time, although activating an expired alert will not cause it to be displayed to users.

Require Auth

If set true, this alert will only be shown to users logged in to the site. If false, it will also appear in the login screen as well as for anonymous users if allowed on the site.

Description

A longer description, which can be accessed through the *Details* link in the alert element. Markdown syntax is supported.

An example of an active alert along with the alert detail page can be seen in the following screenshot.

Create Admin Alert

lessage*	
ert message to be shown for users	
xpiry date*	
12/14/2021	
rt expiration timestamp	
Active Alert status (for disabling the alert before expiration)	
Require auth Require authorization to view alert	
escription	
B I 😪 46 101 ■ 注 듣 喜 酉 🕫 🗠	
Il description of alert (optional, will be shown on a separate page)	
	G Cancel

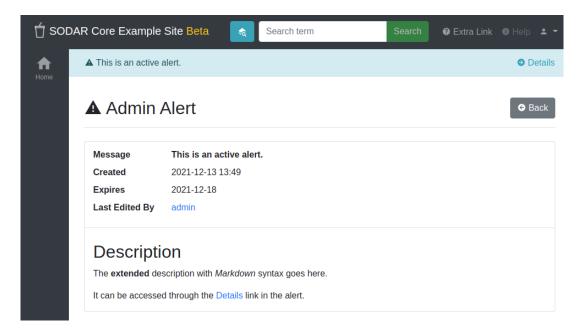

Fig. 17: Admin alert example and details

5.8 Appalerts App

The appalerts site app enables SODAR Core apps to generate alerts for users. The user will receive a notify about these alerts anywhere on the site even if they are tied to a specific project.

5.8.1 Basics

The app consists of two plugins: the site app plugin for alert displaying and the backend plugin to create and access alerts from your SODAR Core based apps.

5.8.2 Installation

Warning: To install this app you **must** have the django-sodar-core package installed and the projectroles app integrated into your Django site. See the *projectroles integration document* for instructions.

Django Settings

Add the app into THIRD_PARTY_APPS in config/settings/base.py as follows:

```
THIRD_PARTY_APPS = [
    # ...
    'adminalerts.apps.AdminalertsConfig',
]
```

Next, make sure the context processor for app alerts is included in the TEMPLATES dictionary:

```
TEMPLATES = [
{
    'OPTIONS': {
        'context_processors': {
            # ...
            'projectroles.context_processors.app_alerts_processor',
            }
        }
    }
}
```

To set the interval for JQuery status updates in the title bar, use APPALERTS_STATUS_INTERVAL and provide the value in seconds. Example:

APPALERTS_STATUS_INTERVAL = env.int('APPALERTS_STATUS_INTERVAL', 5)

URL Configuration

In the Django URL configuration file, add the following line under urlpatterns to include adminalerts URLs in your site.

```
urlpatterns = [
    # ...
    url(r'^alerts/app/', include('appalerts.urls')),
]
```

Migrate Database and Register Plugin

To migrate the Django database and register the appalerts site app plugin, run the following management command:

\$./manage.py migrate

In addition to the database migration operation, you should see the following output:

```
Registering Plugin for appalerts.plugins.SiteAppPlugin
Registering Plugin for appalerts.plugins.BackendPlugin
```

Base Template Include

If your site is overriding the base site template, the following snippet should be added in the javascript block of {SITE}/templates/base.html to enable appalerts JQuery:

```
{% block javascript %}
  {# ... #}
  <!-- App alerts Javascript -->
  {% include 'projectroles/_appalerts_include.html' %}
{% endblock javascript %}
```

5.8.3 Usage

When logged in as an authenticated user, you can find the "App Alerts" option in your user dropdown menu. This displays a list of active alerts you have in the system. You have the possibility to dismiss alerts or follow a related link. The latter action will also dismiss the alert.

When you are anywhere on the site, a notification about existing events will appear on the top bar of the site.

5.8.4 Backend API

For creation and management of alerts, it is recommended to use the backend API to retrieve and use the plugin, without the need for hard-coded includes. The add_alert() helper is also provided to simplify alert creation. See the accompanying API documentation for details.

Note: The logic for alert life cycle management is mostly left to the app issuing alerts. Alerts with an accompanying project or plugin will get deleted with the accompanying object. Please try to make sure you will not e.g. provide a related URL to the event which may no longer be valid when the user accesses the alert.

T SODA	R Core Example Site Beta (1) 2 alerts X Search term Search	🛛 Extra Link 🕕 Help 💄 👻
Ame	App Alerts	× Dismiss All
	C • Test Project Member role changed to "project contributor".	r ×
	2021-10-25 16:04 ● ● Test Project Membership granted with the role of "project guest".	r × .

Fig. 18: App alert list and title bar notification

5.8.5 Backend Django API Documentation

The backend API can be retrieved as follows.

```
from projectroles.plugins import get_backend_api
app_alerts = get_backend_api('appalerts_backend')
```

Make sure to also enable appalerts_backend in the ENABLED_BACKEND_PLUGINS Django setting.

class appalerts.api.AppAlertAPI

Bases: object

App Alerts backend API

classmethod add_alert(app_name, alert_name, user, message, level='INFO', url=None, project=None)

Create an AppAlert.

Parameters

- app_name Name of app plugin which creates the alert (string)
- alert_name Internal alert name string
- user User object for user receiving the alert
- **message** Message string (can contain HTML)
- level Alert level string (INFO, SUCCESS, WARNING or DANGER)
- url URL for following up on alert (string, optional)
- project Project the alert belongs to (Project object, optional)

Raise

ValueError if the plugin is not found or the level is invalid

Returns

AppAlert object

classmethod get_model()

Return AppAlert model for direct model access.

Returns

AppAlert class

5.9 Bgjobs App

The bgjobs app allows for the management of project-specific and asynchronous server-side background jobs.

TODO: Docs to be filled out

5.9.1 Bgjobs Installation

This document provides instructions and guidelines for installing the bgjobs app to be used with your SODAR Core enabled Django site.

Warning: To install this app you **must** have the django-sodar-core package installed and the projectroles app integrated into your Django site. See the *projectroles integration document* for instructions.

Django Settings

The bgjobs app is available for your Django site after installing django-sodar-core. Add the app into THIRD_PARTY_APPS as follows:

```
THIRD_PARTY_APPS = [
    # ...
    'bgjobs.apps.BgjobsConfig',
]
```

URL Configuration

In the Django URL configuration file, add the following line under urlpatterns to include bgjobs URLs in your site.

```
urlpatterns = [
    # ...
    url(r'^bgjobs/', include('bgjobs.urls')),
]
```

Migrate Database and Register Plugin

To migrate the Django database and register the bgjobs app and job type plugins, run the following management command:

```
$ ./manage.py migrate
```

In addition to the database migration operation, you should see the following output:

```
Registering Plugin for bgjobs.plugins.ProjectAppPlugin
Registering Plugin for bgjobs.plugins.BackgroundJobsPluginPoint
```

Celery Setup

TODO

5.9.2 Bgjobs Usage

Usage instructions for the bgjobs app are detailed in this document.

TODO

5.10 Filesfolders App

The filesfolders app enables uploading small files into the Django database and organizing them in folders. It also permits creating hyperlinks, providing public links to files and automated unpacking of ZIP archives.

The app is displayed as "Small Files" on the SODAR site.

5.10.1 Filesfolders Installation

This document provides instructions and guidelines for installing the filesfolders app to be used with your SODAR Core enabled Django site.

Warning: To install this app you **must** have the django-sodar-core package installed and the projectroles app integrated into your Django site. See the *projectroles integration document* for instructions.

Django Settings

The filesfolders app is available for your Django site after installing django-sodar-core. Add the app, along with the prerequisite django_db_storage app into THIRD_PARTY_APPS as follows:

```
THIRD_PARTY_APPS = [
    # ...
    'filesfolders.apps.FilesfoldersConfig',
    'db_file_storage',
]
```

Next set the db_file_storage app as the default storage app for your site:

DEFAULT_FILE_STORAGE = 'db_file_storage.storage.DatabaseFileStorage'

Fill out filesfolders app settings to fit your site. The settings variables are explained below:

- FILESFOLDERS_MAX_UPLOAD_SIZE: Max size for an uploaded file in bytes (int)
- FILESFOLDERS_MAX_ARCHIVE_SIZE: Max size for an archive file to be unpacked in bytes (int)
- FILESFOLDERS_SERVE_AS_ATTACHMENT: If true, always serve downloaded files as attachment instead of opening them in browser (bool)
- FILESFOLDERS_LINK_BAD_REQUEST_MSG: Message to be displayed for a bad public link request (string)

Example of default values:

```
# Filesfolders app settings
FILESFOLDERS_MAX_UPLOAD_SIZE = env.int(
    'FILESFOLDERS_MAX_UPLOAD_SIZE', 10485760)
FILESFOLDERS_MAX_ARCHIVE_SIZE = env.int(
    'FILESFOLDERS_MAX_ARCHIVE_SIZE', 52428800)
FILESFOLDERS_SERVE_AS_ATTACHMENT = False
FILESFOLDERS_LINK_BAD_REQUEST_MSG = 'Invalid request'
```

URL Configuration

In the Django URL configuration file, add the following lines under urlpatterns to include filesfolders URLs in your site. The latter line is required by db_file_storage and should be obfuscated from actual users.

```
urlpatterns = [
    # ...
    url(r'^files/', include('filesfolders.urls')),
    url(r'^OBFUSCATED_STRING_HERE/', include('db_file_storage.urls')),
]
```

Migrate Database and Register Plugin

To migrate the Django database and register the filesfolders app plugin, run the following management command:

\$./manage.py migrate

In addition to the database migration operation, you should see the following output:

```
Registering Plugin for filesfolders.plugins.ProjectAppPlugin
```

5.10.2 Filesfolders Usage

Usage instructions for the filesfolders app are detailed in this document.

Filesfolders UI

You can browse and manage files in the app's main view according to your permissions for each project. The "*File Operations*" menu is used to upload new files as well as add new folders or links. The menu also contains batch moving and deletion operations, for which items can be checked using the right hand side checkboxes.

Updating/deleting operations for single items can be accessed in the dropdown menus for each item. In the item create/update form, you can also *tag* items with a choice of icons and stylings to represent the item status.

When uploading a .zip archive, you may choose the "*Extract files from archive*" option to automatically extract archive files and folders into the filesfolders app. Note that overwriting of files is not currently allowed.

Small Files

> root					
Name	Size	Description	Updated		
example_folder		Example folder	2021-05-28 14:14	¢ -	
🔓 example.jpg 🎔	69.1 KB	Example image	2021-05-28 14:07	\$ -	
🛿 excel_sample.xlsx 🔗 😗	81.5 KB	Publicly available Excel sheet	2021-05-28 14:09	¢ ~

🗅 pdf-sample.pdf 🏲	7.8 KB	PDF example	2021-05-28 14:08	¢ -	

Fig. 19: Filesfolders main view

App Settings

In the project create/update form, set the boolean setting filesfolders.allow_public_links true to allow providing public links to files, for people who can access the site but do not necessarily have a user account or project rights. Note that public link access still has to be granted for each file through its create/update form.

5.10.3 Filesfolders REST API Documentation

This document contains the HTTP REST API documentation for the filesfolders app. The provided API enpoints allow file operations through HTTP API calls in addition to the GUI.

For general information on REST API usage in SODAR Core, see Projectroles REST API Documentation.

class filesfolders.views_api.FolderListCreateAPIView(**kwargs)

List folders or create a folder.

```
URL: /files/api/folder/list-create/{Project.sodar_uuid}
```

Methods: GET, POST

Parameters for POST:

- name: Folder name (string)
- folder: Parent folder UUID (string)
- owner: User UUID of folder owner (string)
- flag: Folder flag (string, optional)
- description: Folder description (string, optional)

class filesfolders.views_api.FolderRetrieveUpdateDestroyAPIView(**kwargs)

Retrieve, update or destroy a folder.

URL:/files/api/folder/retrieve-update-destroy/{Folder.sodar_uuid}

File Operations

Methods: GET, PUT, PATCH, DELETE

Parameters for PUT and PATCH:

- name: Folder name (string)
- folder: Parent folder UUID (string)
- owner: User UUID of folder owner (string)
- flag: Folder flag (string, optional)
- description: Folder description (string, optional)

class filesfolders.views_api.FileListCreateAPIView(**kwargs)

List files or upload a file. For uploads, the request must be made in the multipart format.

URL: /files/api/file/list-create/{Project.sodar_uuid}

Methods: GET, POST

Parameters for POST:

- name: Folder name (string)
- folder: Parent folder UUID (string)
- owner: User UUID of folder owner (string)
- flag: Folder flag (string, optional)
- description: Folder description (string, optional)
- public_url: Allow creation of a publicly viewable URL (bool)
- file: File to be uploaded

class filesfolders.views_api.FileRetrieveUpdateDestroyAPIView(**kwargs)

Retrieve, update or destroy a file.

URL: /files/api/file/retrieve-update-destroy/{File.sodar_uuid}

Methods: GET, PUT, PATCH, DELETE

Parameters for PUT and PATCH:

- name: Folder name (string)
- folder: Parent folder UUID (string)
- owner: User UUID of folder owner (string)
- flag: Folder flag (string, optional)
- description: Folder description (string, optional)
- public_url: Allow creation of a publicly viewable URL (bool)
- file: File to be uploaded

class filesfolders.views_api.FileServeAPIView(**kwargs)

Serve the file content.

URL: /files/api/file/serve/{File.sodar_uuid}

Methods: GET

class filesfolders.views_api.HyperLinkListCreateAPIView(**kwargs)

List hyperlinks or create a hyperlink.

URL: /files/api/hyperlink/list-create/{Project.sodar_uuid}

Methods: GET, POST

Parameters for POST:

- name: Folder name (string)
- folder: Parent folder UUID (string)
- owner: User UUID of folder owner (string)
- flag: Folder flag (string, optional)
- description: Folder description (string, optional)
- url: URL for the link (string)

class filesfolders.views_api.HyperLinkRetrieveUpdateDestroyAPIView(**kwargs)

Retrieve, update or destroy a hyperlink.

URL:/files/api/hyperlink/retrieve-update-destroy/{HyperLink.sodar_uuid}

Methods: GET, PUT, PATCH, DELETE

Parameters for PUT and PATCH:

- name: Folder name (string)
- folder: Parent folder UUID (string)
- owner: User UUID of folder owner (string)
- flag: Folder flag (string, optional)
- description: Folder description (string, optional)
- url: URL for the link (string)

5.11 Siteinfo App

The siteinfo site app enables system administrators and developers to view site details and statistics gathered from project and backend apps.

5.11.1 Basics

The app renders a site which displays information and statistics regarding the site and installed SODAR apps. Providing app statistics for siteinfo done via implementing the get_statistics() function in your app plugins. Currently, access to the app is limited to site administrators.

5.11.2 Installation

Warning: To install this app you **must** have the django-sodar-core package installed and the projectroles app integrated into your Django site. See the *projectroles integration document* for instructions.

Django Settings

The siteinfo app is available for your Django site after installing django-sodar-core. Add the app into THIRD_PARTY_APPS as follows:

```
THIRD_PARTY_APPS = [
    # ...
    'siteinfo.apps.SiteinfoConfig',
]
```

URL Configuration

In the Django URL configuration file, add the following line under urlpatterns to include siteinfo URLs in your site.

```
urlpatterns = [
    # ...
    url(r'^siteinfo/', include('siteinfo.urls')),
]
```

Migrate Database and Register Plugin

To migrate the Django database and register the siteinfo site app plugin, run the following management command:

```
$ ./manage.py migrate
```

In addition to the database migration operation, you should see the following output:

```
Registering Plugin for siteinfo.plugins.SiteAppPlugin
```

5.11.3 Usage

When logged in as a superuser, you can find the "Site Info" link in your user dropdown menu in the top right corner of the site. This application is only available for users with superuser status.

The UI is presented under three tabs:

General

General site information along with statistics provided by the get_statistics() methods implemented in app plugins.

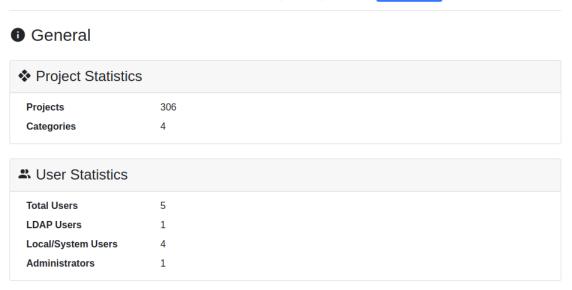

Apps

List of installed and enabled project, site and backend app plugins.

Settings

Django settings for the site. Contains settings from apps as specified in the info_settings member variable in the app plugin.

L Site Info: SODAR Core Dev (Beta)

i General

Apps

≇ Settings

Fig. 20: Siteinfo application with the General tab selected

Providing App Statistics

In your project app or backend plugin, implement the get_statistics() method. It should return a dictionary containing, for each statistics item, a program friendly key and certain member fields:

label

Human readable label for the statistics item.

value

The value to be rendered.

url

The url to link to from the value for additional information (optional).

description

Additional information (optional).

Example:

```
def get_statistics(self):
    return {
        'stat_id': {
            'label': 'Some statistic',
            'value': 9000,
            'url': reverse('home'),
            'description': 'More information here',
        }
    }
}
```

Providing Site Settings

The site settings to be presented in the *Settings* tab should be provided as a list in the info_settings variable of the app plugin.

Example:

```
info_settings = [
    'FILESFOLDERS_LINK_BAD_REQUEST_MSG',
    'FILESFOLDERS_MAX_ARCHIVE_SIZE',
    'FILESFOLDERS_MAX_UPLOAD_SIZE',
    'FILESFOLDERS_SERVE_AS_ATTACHMENT',
    'FILESFOLDERS_SHOW_LIST_COLUMNS',
]
```

Warning: For information security, we recommend against including settings containing secret values such as passwords to be displayed in the siteinfo app.

5.12 Sodarcache App

The sodarcache app provides a generic data caching functionality for a SODAR Core based site. This can be used to e.g. locally cache and aggregate data referring to external sources in order to speed up commonly repeated queries to databases other than the local Django PostgreSQL.

5.12.1 Sodarcache Installation

This document provides instructions and guidelines for installing the sodarcache app to be used with your SODAR Core enabled Django site.

Warning: To install this app you **must** have the django-sodar-core package installed and the projectroles app integrated into your Django site. See the *projectroles integration document* for instructions.

Django Settings

The sodarcache app is available for your Django site after installing django-sodar-core. Add the app into THIRD_PARTY_APPS as follows:

```
THIRD_PARTY_APPS = [
    # ...
    'sodarcache.apps.SodarCacheConfig',
]
```

You also need to add the sodarcache backend plugin in enabled backend plugins.

```
ENABLED_BACKEND_PLUGINS = [
    # ...
    'sodar_cache',
]
```

URL Configuration

In the Django URL configuration file, add the following lines under urlpatterns to include sodarcache URLs in your site.

```
urlpatterns = [
    # ...
    url(r'^cache/', include('sodarcache.urls')),
]
```

Migrate Database and Register Plugin

To migrate the Django database and register the sodarcache app plugin, run the following management command:

```
$ ./manage.py migrate
```

In addition to the database migration operation, you should see the following output:

Registering Plugin for sodarcache.plugins.BackendPlugin

5.12.2 Sodar Cache Usage

Usage instructions for the sodarcache app are detailed in this document.

Backend API for Data Caching

The Django backend API for caching data is located in sodarcache.api. Details of the API can be found in *Sodarcache Django API Documentation*.

Invoking the API

The API is accessed through a backend plugin. This means you can write calls to the API without any hard-coded imports and your code should work even if the sodarcache app has not been installed on the site.

Initialize the API using projectroles.plugins.get_backend_api() as follows:

```
from projectroles.plugins import get_backend_api
cache_backend = get_backend_api('sodar_cache')
```

Setting and Getting Cache Items

Once you can access the sodarcache backend, you should set up the update_cache() function in the ProjectAppPlugin of the app with which you want to cache or aggregate data. The update process can be limited by two parameters: cached item name and project. If neither are specified, the function should update cached data for all known items within all projects.

```
def update_cache(self, name=None, project=None):
"""
Update cached data for this app, limitable to item ID and/or project.
:param project: Project object to limit update to (optional)
:param name: Item name to limit update to (string, optional)
"""
# TODO: Implement this in your app plugin
return None
```

Updating a specific cache item within the update_cache() function (or elsewhere) should be done using sodarcache.api.set_cache_item(). A minimal example is as follows:

Note: The item ID in the name argument is not unique, but it is expected to be unique together with the project and app_name arguments.

Retrieve items with get_cache_item() or just check the time the item was last updated with get_update_time() like this:

```
cache_backend.get_cache_item(
    app_name='yourapp',
    name='some_item',
    project=project,
    data_type='json'
) # Returns a JsonCacheItem
cache_backend.get_update_time(
    app_name='yourapp',
    name='some_item',
    project=project
)
```

It is also possible to retrieve a Queryset with all cached items for a specific project with get_project_cache().

```
cache_backend.get_project_cache(
    project=project,  # Project object
    data_type='json'  # must be 'json' for JsonCacheItem
    )
```

Management Commands

To create or update the data cache for all apps and projects, you can use a management command.

\$./manage.py synccache

To limit the sync to a specific project, you can provide the -p or --project argument with the project UUID.

\$./manage.py synccache -p e9701604-4ccc-426c-a67c-864c15aff6e2

Similarly, there is a command to delete all cached data:

\$./manage.py deletecache

5.12.3 Sodarcache Django API Documentation

This document contains Django API documentation for the backend plugin in the sodarcache app. Included are functionalities and classes intended to be used by other applications.

Backend API

The backend API can be retrieved as follows.

```
from projectroles.plugins import get_backend_api
app_alerts = get_backend_api('sodar_cache')
```

Make sure to also enable sodar_cache in the ENABLED_BACKEND_PLUGINS Django setting.

class sodarcache.api.SodarCacheAPI

SodarCache backend API to be used by Django apps.

classmethod delete_cache(app_name=None, project=None)

Delete cache items. Optionally limit to project and/or user.

Parameters

- app_name Name of the app which sets the item (string)
- project Project object (optional)

Returns

Integer (deleted item count)

Raise

ValueError if app_name is given but invalid

classmethod get_cache_item(app_name, name, project=None)

Return cached data by app_name, name (identifier) and optional project. Returns None if not found.

Parameters

- **name** Item name (string)
- app_name Name of the app which sets the item (string)
- project Project object (optional)

Returns

JSONCacheItem object

Raise

ValueError if app_name is invalid

classmethod get_project_cache(project, data_type='json')

Return all cached data for a project.

Parameters

- **project** Project object
- data_type String stating the data type of the cache items

Returns

QuerySet

Raise

ValueError if data_type is invalid

classmethod get_update_time(app_name, name, project=None)

Return the time of the last update of a cache object as seconds since epoch.

Parameters

- **name** Item name (string)
- **app_name** Name of the app which sets the item (string)
- project Project object (optional)

Returns

Float

classmethod set_cache_item(app_name, name, data, data_type='json', project=None, user=None)

Create or update and save a cache item.

Parameters

- app_name Name of the app which sets the item (string)
- **name** Item name (string)
- **data** Item data (dict)
- data_type String stating the data type of the cache items
- project Project object (optional)
- **user** User object to denote user triggering the update (optional)

Returns

JSONCacheItem object

Raise

ValueError if app_name is invalid

Raise

ValueError if data_type is invalid

classmethod update_cache(name=None, project=None, user=None)

Update items by certain name within a project by calling implemented functions in project app plugins.

Parameters

- **name** Item name to limit update to (string, optional)
- project Project object to limit update to (optional)

• user – User object to denote user triggering the update (optional)

Models

```
class sodarcache.models.BaseCacheItem(*args, **kwargs)
```

Abstract class representing a cached item

app_name

App name

date_modified

DateTime of the update

name

Identifier for the item given by the data setting app

project

Project in which the item belongs (optional)

sodar_uuid

UUID for the item

user

User who updated the item (optional)

class sodarcache.models.JSONCacheItem(*args, **kwargs)

Class representing a cached item in JSON format

exception DoesNotExist

exception MultipleObjectsReturned

data

Cached data as JSON

project

Project in which the item belongs (optional)

user

User who updated the item (optional)

5.13 Timeline App

The timeline app enables the developer of a SODAR Core based site to log project related or site-wide events and link objects (both existing and deleted) to those events.

Unlike the standard Django object history accessible in the admin site, these events are not restricted to creation/modification of objects in the Django database, but can concern any user-triggered activity.

The events can also have multiple temporal status states in case of e.g. events requiring async requests.

The app provides front-end views to list timeline events for projects, categories, objects and site-wide actions. Also included is a backend API for saving desired activity as timeline events. For details on how to use these, see the *timeline usage documentation*.

5.13.1 Timeline Installation

This document provides instructions and guidelines for installing the timeline app to be used with your SODAR Core enabled Django site.

Warning: To install this app you **must** have the django-sodar-core package installed and the projectroles app integrated into your Django site. See the *projectroles integration document* for instructions.

Django Settings

The timeline app is available for your Django site after installing django-sodar-core. Add the app into THIRD_PARTY_APPS as follows:

```
THIRD_PARTY_APPS = [
    # ...
    'timeline.apps.TimelineConfig',
]
```

You also need to add the timeline backend plugin in enabled backend plugins.

```
ENABLED_BACKEND_PLUGINS = [
    # ...
    'timeline_backend',
]
```

Optional Settings

To alter default timeline app settings, insert the following **optional** variables with values of your choosing:

```
# Timeline app settings
TIMELINE_PAGINATION = 15  # Number of events to be shown on one page (int)
```

URL Configuration

In the Django URL configuration file, add the following line under urlpatterns to include timeline URLs in your site.

```
urlpatterns = [
    # ...
    url(r'^timeline/', include('timeline.urls')),
]
```

Migrate Database and Register Plugin

To migrate the Django database and register the timeline app/backend plugins, run the following management command:

\$./manage.py migrate

In addition to the database migration operation, you should see the following output:

```
Registering Plugin for timeline.plugins.ProjectAppPlugin
Registering Plugin for timeline.plugins.BackendPlugin
```

5.13.2 Timeline Usage

Usage instructions for the timeline app are detailed in this document.

Timeline UI

You can browse events by navigating to a project or a category and selecting the "Timeline" app from the project sidebar. Alternatively, a view for site-wide events (not linked to a project) can be found in the user menu on the top right corner of the site.

By clicking on the time stamp for each event, you can view the details on different stages of event execution, in case of e.g. asynchronous events.

By clicking on the clock icon next to an object link in the event description, you can view the event history of that object. The link itself will take you to the relevant view for the object on your Django site.

Certain events have a file icon in their description. If clicked, a popup showing a collection of extra data for the given event will appear. The popup will display extra data of the event itself and of the different states the event went through, if there are any.

Admin users are able to see certain "classified" level events hidden from normal users.

					.
Timestamp	Event	User	Description		Status
2021-05-28 14:22:49	ᅌ project_star	alice	star project	۵	INFO

Project Timeline

Fig. 21: Timeline event list view

Backend API for Event Logging

The Django backend API for logging events is located in timeline.api. For the full documentation, see here.

Invoking the API

The API is accessed through a backend plugin. This means you can write calls to the API without any hard-coded imports and your code should work even if the timeline app has not been installed on the site.

The most common use case is to save events within the Class-Based Views of your Django site, but technically this can be done by any part of the code in your Django apps.

Initialize the API using projectroles.plugins.get_backend_api() as follows:

```
from projectroles.plugins import get_backend_api
timeline = get_backend_api('timeline_backend')
if timeline:  # Only proceed if the backend was successfully initialized
    pass  # Save your events here..
```

Adding an Event

Once you can access the timeline backend, add the event with timeline.add_event(). A minimal example is as follows:

Linking an Object

Say you want to link a Django model object to the event for tracking its history? In this example, let's say it's a SODAR Core compatible User model object user_obj.

Note: The given object **must** contain an **sodar_uuid** field with an auto-generated UUID. For more information, see the *project app development document*.

Create the event as in the previous section, but add a label target_user in the description. The name of the label is arbitrary:

```
tl_event = timeline.add_event(
    project=project,
    app_name=APP_NAME,
    user=request.user,
    event_name='some_event',
    description='Do something to {target_user}')
```

All you have to do is add an object reference to the created event:

```
obj_ref = tl_event.add_object(
    obj=user_obj,
    label='target_user',
    name=user_obj.username)
```

The name field specifies which name the object will be referred to when displaying the event description to a user.

Defining Object References

The example before is all fine and good for a User object, but what about your own custom Django model?

When encountering an unknown object model from your app, timeline will call the get_object_link() function in the ProjectAppPlugin defined for your app. Make sure to implement it for all the relevant models in your app.

Displaying Object Links

In order to display object links with timeline history link included, you can use the timeline.api. get_object_link() function in your app's template tags.

Defining Status States

Note: If your Django apps only deal with normal synchronous requests, you don't need to pay attention to this functionality right now.

By default, timeline.add_event() treats events as synchronous and automatically saves them with the status of OK. However, in case of e.g. asynchronous requests, you can alter this by setting the status_type and (optionally) status_desc types upon creation.

```
tl_event = timeline.add_event(
    project=project,
    app_name=APP_NAME,
    user=request.user,
    event_name='some_event',
    description='Description',
    status_type='SUBMIT',
    status_desc='Just submitted this')
```

After that, you can add new status states for the event using the object returned by timeline.add_event():

tl_event.set_status('OK', 'Submission was successful!')

Currently supported status types are listed below, some only applicable to async events:

- OK: All OK, event successfully performed
- INFO: Used for events which do not change anything, e.g. viewing something within an app
- INIT: Initializing the event in progress
- SUBMIT: Event submitted asynchronously
- FAILED: Asynchronous event submission failed

• CANCEL: Event cancelled

Extra Data

Extra data can be added in the JSON format for both events and their status states with the extra_data and status_extra_data parameters.

Speciying a label {extra-NAME} in the event description will lead to a callback to get_extra_data_link() in the app plugin. To support this you need to make sure to implement the get_extra_data_link() function in your plugin.

Classified Events

To mark an event "*classified*", that is, restricting its visibility to project owners and admins, set the classified argument to true when invoking timeline.add_event().

Note: Multiple levels of classification may be introduced to the timeline event model in the future.

5.13.3 Timeline Django API Documentation

This document contains Django API documentation for the timeline app. Included are functionalities and classes intended to be used by other applications.

Backend API

The backend API can be retrieved as follows.

```
from projectroles.plugins import get_backend_api
app_alerts = get_backend_api('timeline_backend')
```

Make sure to also enable timeline_backend in the ENABLED_BACKEND_PLUGINS Django setting.

class timeline.api.TimelineAPI

Timeline backend API to be used by Django apps.

Create and save a timeline event.

Parameters

- project Project object or None
- **app_name** Name of app from which event was invoked (must correspond to "name" attribute of app plugin)
- user User invoking the event or None
- event_name Event ID string (must match schema)
- description Description of status change (may include {object label} references)
- **classified** Whether event is classified (boolean, optional)

- **extra_data** Additional event data (dict, optional)
- **status_type** Initial status type (string, optional)
- **status_desc** Initial status description (string, optional)
- status_extra_data Extra data for initial status (dict, optional)
- **plugin_name** Name of plugin to which the event is related (optional, plugin with the name of the app is assumed if unset)

Returns

ProjectEvent object

Raise

ValueError if app_name or status_type is invalid

classmethod get_event_description(event, plugin_lookup=None, request=None)

Return the description of a timeline event as HTML.

Parameters

- event ProjectEvent object
- **plugin_lookup** App plugin lookup dict (optional)
- request Request object (optional)

Returns

String (contains HTML)

classmethod get_models()

Return project event model classes for custom/advanced queries.

Returns

ProjectEvent, ProjectEventObjectRef

classmethod get_object_link(obj, project=None)

Return an inline HTML icon link for a timeline event object history.

Parameters

- obj Django database object
- project Related Project object or None

Returns

String (contains HTML)

classmethod get_object_url(obj, project=None)

Return the URL for a timeline event object history.

Parameters

- obj Django database object
- project Related Project object or None

Returns

String

classmethod get_project_events(project, classified=False)

Return timeline events for a project.

Parameters

- project Project object
- **classified** Include classified (boolean)
- Returns

QuerySet

Models

Models for the timeline app

class timeline.models.ProjectEvent(*args, **kwargs)

Class representing a Project event. Can also be a site-wide event not linked to a specific project.

exception DoesNotExist

exception MultipleObjectsReturned

add_object(obj, label, name, extra_data=None)

Add object reference to an event.

Parameters

- **obj** Django object to which we want to refer
- label Label for the object in the event description (string)
- **name** Name or title of the object (string)
- extra_data Additional data related to object (dict, optional)

Returns

ProjectEventObjectRef object

app

App from which the event was triggered

classified

Event is classified (only viewable by user levels specified in rules)

description

Description of status change (may include {object_name} references)

event_name

Event ID string

extra_data

Additional event data as JSON

get_current_status()

Return the current event status

get_status()

Return the current event status

get_status_changes(reverse=False)

Return all status changes for the event

get_timestamp()

Return the timestamp of current status

plugin

Plugin to which the event is related (optional)

project

Project to which the event belongs

set_status(status_type, status_desc=None, extra_data=None)

Set event status.

Parameters

- **status_type** Status type string (see EVENT_STATUS_TYPES)
- **status_desc** Description string (optional)
- **extra_data** Extra data for the status (dict, optional)

Returns

ProjectEventStatus object

Raise

TypeError if status_type is invalid

sodar_uuid

UUID for the event

user

User who initiated the event (optional)

class timeline.models.ProjectEventManager(*args, **kwargs)

Manager for custom table-level ProjectEvent queries

get_object_events(project, object_model, object_uuid, order_by='-pk')

Return events which are linked to an object reference.

Parameters

- project Project object or None
- **object_model** Object model (string)
- **object_uuid** sodar_uuid of the original object
- **order_by** Ordering (default = pk descending)

Returns

QuerySet

class timeline.models.ProjectEventObjectRef(*args, **kwargs)

Class representing a reference to an object (existing or removed) related to a Timeline event status

exception DoesNotExist

exception MultipleObjectsReturned

event

Event to which the object belongs

extra_data

Additional data related to the object as JSON

label

Label for the object related to the event

name

Name or title of the object

object_model

Object model as string

object_uuid

Object SODAR UUID

class timeline.models.ProjectEventStatus(*args, **kwargs)

Class representing a Timeline event status

exception DoesNotExist

exception MultipleObjectsReturned

description

Description of status change (optional)

event

Event to which the status change belongs

extra_data

Additional status data as JSON

status_type

Type of the status change

timestamp

DateTime of the status change

5.14 Tokens App

The tokens site app enables users to issue and manage access tokens for REST API views used on your SODAR Core based Django site.

5.14.1 Basics

Users can use this app to create and delete access tokens. These can be set to expire or work until deleted.

5.14.2 Installation

Warning: To install this app you **must** have the django-sodar-core package installed and the projectroles app integrated into your Django site. See the *projectroles integration document* for instructions.

Django Settings

The site of app is available for your Django site after installing django-sodar-core. Add the app into THIRD_PARTY_APPS as follows:

```
THIRD_PARTY_APPS = [
    # ...
    'tokens.apps.TokensConfig',
]
```

URL Configuration

In the Django URL configuration file, add the following line under urlpatterns to include siteinfo URLs in your site.

```
urlpatterns = [
    # ...
    url(r'^tokens/', include('tokens.urls')),
]
```

Register Plugin

To register the siteinfo site app plugin, run the following management command:

\$./manage.py syncplugins

You should see the following output:

Registering Plugin for tokens.plugins.SiteAppPlugin

5.14.3 Usage

When logged in to SODAR, you can find the "API Tokens" link in your user dropdown menu in the top right corner of the site.

Select "Create Token" from the "Token Operations" dropdown to create a new token. You will only see the token once, so make sure to copy it to clipboard at this point.

Deleting existing tokens can be done from the token list.

5.15 Userprofile App

The userprofile app is a site app which provides a user profile view for projectroles compatible Django users and management of user specific settings.

5.15.1 Installation

It is **strongly recommended** to install the userprofile app into your site when using projectroles, unless you require a specific user profile providing app of your own.

Warning: To install this app you **must** have the django-sodar-core package installed and the projectroles app integrated into your Django site. See the *projectroles integration document* for instructions.

Django Settings

The userprofile app is available for your Django site after installing django-sodar-core. Add the app into THIRD_PARTY_APPS as follows:

```
THIRD_PARTY_APPS = [
    # ...
    'userprofile.apps.UserprofileConfig',
]
```

URL Configuration

In the Django URL configuration file, add the following line under urlpatterns to include userprofile URLs in your site.

```
urlpatterns = [
    # ...
    url(r'^user/', include('userprofile.urls')),
]
```

Register Plugin

To register the app plugin, run the following management command:

```
$ ./manage.py syncplugins
```

You should see the following output:

Registering Plugin for userprofile.plugins.ProjectAppPlugin

5.15.2 Usage

After successful installation, the link for "User Profile" should be available in the user dropdown menu in the top-right corner of the website UI after you have logged in.

5.15.3 User Settings

User settings are configured in the app_settings dictionary in your project app plugins.

User settings defined in the projectroles app, available for all SODAR Core using sites:

Display Project UUID Copying Link

If set true, display a link in the project title bar for copying the project UUID into the clipboard.

Additional Email

In addition to the default user email, also send email notifications to these addresses.

In the development setup, the SODAR Core example site apps also provide additional settings for demonstrating settings features.

5.16 Site Development

This section contains instructions and guidelines for developing apps for your SODAR Core based site.

We first describe the process of developing *project apps*, which are the most common type of app on SODAR Core based sites. In the following pages we discuss *site apps* and *backend apps*, followed by general *resources* and *guidelines* for development.

For development of the SODAR Core package itself, see Contributing and SODAR Core Development.

5.17 Project App Development

This document details instructions and guidelines for developing **project apps** to be used with the SODAR Core framework. This also applies for modifying existing Django apps into project apps.

Hint: The package example_project_app in the projectroles repository provides a concrete minimal example of a working project app.

5.17.1 Project App Basics

Characteristics of a project app:

- Provides a functionality related to a project.
- Is dynamically included in project views by projectroles using plugins.
- Uses the project-based role and access control provided by projectroles.
- Is (optionally) included in projectroles search.
- Provides a dynamically included element (e.g. content overview) for the project details page.
- Appears in the project menu sidebar in the default projectroles templates.

Requirements for setting up a project app:

- Implement project relations and SODAR UUIDs in the app's Django models.
- Use provided mixins, keyword arguments and conventions in views.
- Extend projectroles base templates in your templates.
- Implement specific templates for dynamic inclusion by Projectroles.
- Implement plugins.py with definitions and function implementations.
- Implement rules.py with access rules.

Fulfilling these requirements is detailed further in this document.

5.17.2 Prerequisites

This documentation assumes you have a Django site with the projectroles app set up, either started with sodardjango-site or by integrating SODAR Core on an existing site (see *projectroles integration*). The instructions can be applied either to modify a previously existing app, or to set up a fresh app generated in the standard way with ./manage.py startapp.

It is also assumed that apps are more or less created according to best practices defined by Two Scoops, with the use of Class-Based Views being a requirement.

5.17.3 Models

In order to hook up your Django models into projects, there are two requirements: implementing a **project foreign key** and a **UUID field**.

Project Foreign Key

Add a ForeignKey field for the projectroles.models.Project model, either called project or accessible with a get_project() function implemented in your model.

If the project foreign key for your model is **not** project, make sure to define a get_project_filter_key() method. It should return the name of the field to use as key for filtering your model by project.

Note: If your app contains a complex model structure with e.g. nested models using foreign keys, it's not necessary to add this to all your models, just the topmost one(s) used e.g. in URL kwargs.

Model UUID Field

To provide a unique identifier for objects in the SODAR context, add a UUIDField with the name of sodar_uuid into your model.

Note: SODAR Core links to objects in URLs, links and forms using UUIDs instead of database private keys. This is strongly recommended for all Django models in apps using the SODAR Core framework.

Note: When updating an existing Django model with an existing database, the sodar_uuid field needs to be populated. See instructions in Django documentation on how to create the required migrations.

Model Example

Below is an example of a projectroles-compatible Django model:

```
import uuid
from django.db import models
from projectroles.models import Project
class SomeModel(models.Model):
    some field = models.CharField(
```

(continues on next page)

(continued from previous page)

```
help_text='Your own field'
)
project = models.ForeignKey(
    Project,
    related_name='some_objects',
    help_text='Project to which this object belongs',
)
sodar_uuid = models.UUIDField(
    default=uuid.uuid4,
    unique=True,
    help_text='SomeModel SODAR UUID',
)
```

Note: The related_name field is optional, but recommended as it provides an easy way to lookup objects of a certain type related to a project. For example the project foreign key in a model called Document could feature e.g. related_name='documents'.

5.17.4 Rules File

Create a file rules.py in your app's directory. You should declare at least one basic permission for enabling a user to view the app data for the project. This can be named e.g. {APP_NAME}.view_data. Common predicates for the rules file can be found in projectroles.rules. They can be extended within your app if needed.

```
import rules
from projectroles import rules as pr_rules
rules.add_perm(
    'example_project_app.view_data',
    pr_rules.is_project_owner
    | pr_rules.is_project_delegate
    | pr_rules.is_project_contributor
    | pr_rules.is_project_guest,
)
```

Hint: The rules.is_superuser predicate is often redundant, as permission checks are skipped for Django superusers. However, it can be handy if you e.g. want to define a rule allowing only superuser access for now, with the potential for adding other predicates later.

5.17.5 ProjectAppPlugin

Create a file plugins.py in your app's directory. In the file, declare a ProjectAppPlugin class implementing projectroles.plugins.ProjectAppPluginPoint. Within the class, implement member variables and functions as instructed in comments and docstrings.

```
from projectroles.plugins import ProjectAppPluginPoint
from .urls import urlpatterns

class ProjectAppPlugin(ProjectAppPluginPoint):
    """Plugin for registering app with Projectroles"""
    name = 'yourprojectapp'
    title = 'Your Project App'
    urls = urlpatterns
    # ...
```

The following variables and functions are mandatory:

name

App name. In most cases this should match the app package name.

title

Printable app title.

urls

Urlpatterns, usually imported from the app's urls.py file.

icon

Iconify collection and icon name (e.g. mdi:home).

entry_point_url_id

View ID for the app entry point (**NOTE:** The view **must** take the project sodar_uuid as a kwarg named project).

description

Verbose description of the app.

app_permission

Basic permission for viewing app data in the related project (see above).

search_enable

Boolean for enabling/disabling app search.

details_template

Path to template to be included in the project details page, usually called {APP_NAME}/_details_card.html.

details_title

Title string to be displayed in the project details page for the app details template.

plugin_ordering

Number to define the ordering of the app on the project menu sidebar and the details page.

Implementing the following is **optional**:

app_settings

Implement if project, user or project_user (Settings specific to a project and user) specific settings for the app are needed. See the plugin point definition for an example.

search_types

Implement if searching the data of the app is enabled.

search_template

Implement if searching the data of the app is enabled.

project_list_columns

Optional custom columns do be shown in the project list. See the plugin point definition for an example.

category_enable

Whether the app should also be made available for categories. Defaults to False and should only be overridden when required. For an example of a project app enabled in categories, see *Timeline*.

info_settings

List of names for app-specific Django settings to be displayed for administrators in the siteinfo app.

get_object_link()

Return object link for a Timeline event.

get_extra_data_link()

Return extra data link for a Timeline event.

search()

Function called when searching for data related to the app if search is enabled.

get_statistics()

Return statistics for the siteinfo app. See details in the siteinfo documentation.

get_project_list_value()

A function which **must** be implemented if **project_list_columns** are defined, to retrieve a column cell value for a specific project.

handle_project_update()

A function for enabling carrying out specific tasks within your app when the project is updated in projectroles. This is a work-in-progress functionality to be expanded later.

Once you have implemented the rules.py and plugins.py files and added the app and its URL patterns to the Django site configuration, you can create the project app plugin in the Django databse with the following command:

\$./manage.py syncplugins

You should see the following output to ensure the plugin was successfully registered:

Registering Plugin for {APP_NAME}.plugins.ProjectAppPlugin

For info on how to implement the specific required views/templates, see the rest of this document.

5.17.6 Views

Certain guidelines must be followed in developing Django web UI views for them to be successfully used with projectroles.

URL Keyword Arguments

In order to link a view to project and check user permissions using mixins, the URL keyword arguments **must** include an argument which matches *one of the following conditions*:

- Contains a kwarg project which corresponds to the sodar_uuid member value of a projectroles.models. Project object
- Contains a kwarg corresponding to the sodar_uuid of another Django model, which must contain a member field project which is a foreign key for a Projectroles.models.Project object. The kwarg **must** be named after the Django model of the referred object (in lowercase).
- Same as above, but the Django model provides a get_project() function which returns a Projectroles. models.Project object.
- Contains a kwarg corresponding to a model in another app. The app must be specified in the URL kwarg as app__model.

Examples:

```
urlpatterns = [
    # Direct reference to the Project model
   url(
        regex=r'^(?P<project>[0-9a-f-]+)$',
        view=views.ProjectDetailView.as_view(),
       name='detail',
   ),
    # RoleAssignment model has a "project" member which is also OK
   url(
        regex=r'^members/update/(?P<roleassignment>[0-9a-f-]+)$',
        view=views.RoleAssignmentUpdateView.as_view(),
       name='role_update',
   ),
    # Reference to a model in another app
   url(
        regex=r'^example/path/(?P<filesfolders__folder>[0-9a-f-]+)$'.
        view=views.ExampleView.as_view(),
       name='example_ext_model',
   ),
]
```

Mixins

The projectroles.views module provides several useful mixins for augmenting your view classes to add projectroles functionality. These can be found in the projectroles.views module.

The most commonly used mixins:

LoginRequiredMixin

Override of the standard Django mixin which may also allow anonymous guests if so configured in SODAR Core. If you plan on supporting anonymous users on your site, you **must** use this mixing instead of the original one in Django.

LoggedInPermissionMixin

Ensure correct redirection of users on no permissions.

ProjectPermissionMixin

Provides a Project object for permission checking based on URL kwargs.

ProjectContextMixin

Provides a Project object into the view context based on URL kwargs.

See example_project_app.views.ExampleView for an example.

5.17.7 Templates

Template Structure

It is strongly recommended to extend projectroles/project_base.html in your project app templates. Just start your template with the following line:

{% extends 'projectroles/project_base.html' %}

The following **template blocks** are available for overriding or extending when applicable:

title

Page title.

css

Custom CSS (extend with {{ block.super }}).

projectroles_extend

Your app content goes here.

javascript

Custom Javascript (extend with {{ block.super }}).

head_extend

Optional block if you need to include additional content inside the HTML <head> element.

Within the projectroles_extend block, it is recommended to use the following div classes, both extending the Bootstrap 4 container-fluid class:

sodar-subtitle-container

Container for the page title.

sodar-content-container

Container for the actual content of your app.

If you do not want to include the project title header to your project templates, you can replace the projectroles_extend block with a projectroles block.

Warning: When customizing your templates, make sure you are not accidentally nesting built-in blocks within eachother by e.g. placing the css block *inside* the projectroles or projectroles_extend block. Doing so may cause the page to render incorrectly or includes to fail.

Rules

To control user access within a template with permissions introduced in rules.py, do it as follows:

```
{% load rules %}
{% has_perm 'app.do_something' request.user project as can_do_something %}
```

This checks if the current user from the HTTP request has permission for app.do_something in the current project retrieved from the page context.

Common Template Tags

General purpose template tags are available in projectroles/templatetags/projectroles_common_tags.py. Include them to your template as follows:

{% load projectroles_common_tags %}

See the template tag API documentation for detailed instructions on using different tags in your templates.

Example

Minimal example for a project app template:

```
{% extends 'projectroles/project_base.html' %}
{% load projectroles_common_tags %}
{% load rules %}
{% block title %}
 Page Title
{% endblock title %}
{% block head_extend %}
 {# OPTIONAL: extra content under <head> goes here #}
{% endblock head_extend %}
{% block css %}
 {{ block.super }}
  {# OPTIONAL: Extend or override CSS here #}
{% endblock css %}
{% block projectroles_extend %}
  {# Page subtitle #}
 <div class="container-fluid sodar-subtitle-container">
   <h3>
      <i class="iconify" data-icon="mdi:rocket-launch"></i>
     App and/or Page Title
   </h3>
 </div>
  {# App content #}
```

(continues on next page)

(continued from previous page)

```
<div class="container-fluid sodar-page-container">
    Your app content goes here!
  </div>
{% endblock projectroles_extend %}
{% block javascript %}
{{ block.super }}
{# OPTIONAL: include additional Javascript here #}
{% endblock javascript %}
```

See example_project_app/example.html for a working and fully commented example of a minimal template.

Hint: If you include some controls on your sodar-subtitle-container class and want it to remain sticky on top of the page while scrolling, use row instead of container-fluid and add the bg-white sticky-top classes to the element.

5.17.8 General Guidelines for Views and Templates

General guidelines and hints for developing views and templates are discussed in this section.

Referring to Project Type

SODAR Core allows customizing the display name for the project type from the default "project" or "category". For more information, see *Projectroles Customization*.

It is thus recommended that instead of hard coding "project" or "category" in your views or templates, use the get_display_name() function to refer to project type.

In templates, this can be achieved with a custom template tag. Example:

```
{% load projectroles_common_tags %}
{% get_display_name project.type title=True plural=False %}
```

In views and other Python code, the similar function can be accessed through utils.py:

```
from projectroles.utils import get_display_name
display_name = get_display_name(project.type, plural=False)
```

Hint: If not dealing with a Project object, you can provide the PROJECT_TYPE_* constant from SODAR_CONSTANTS. In templates, it's most straightforward to use "CATEGORY" and "PROJECT".

5.17.9 Specific Views and Templates

A few specific views/templates are expected to be implemented.

App Entry Point

As described in the Plugins chapter, an app entry point view is to be defined in the ProjectAppPlugin. This is **mandatory**.

The view must take a project URL kwarg which corresponds to a Project.sodar_uuid.

For an example, see example_project_app.views.ExampleView and the associated template.

Project Details Element

A sub-template to be included in the project details page (the project's "front page" provided by projectroles, where e.g. overview of app content is shown).

Traditionally these files are called _details_card.html, but you can name them as you wish and point to the related template in the details_template variable of your plugin.

It is expected to have the content in a card-body container:

```
<div class="card-body">
{# Content goes here #}
</div>
```

5.17.10 Project Search API and Template

If you want to implement search in your project app, you need to implement the search() method in your plugin as well as a template for displaying the results.

Hint: Implementing search *can* be complex. If you have access to the main SODAR repository, apps in that project might prove useful examples.

The search() Function

See the signature of search() in projectroles.plugins.ProjectAppPluginPoint. The arguments are as follows:

search_terms

- One or more terms to be searched for (list of strings). Expected to be combined with OR operators in your search logic.
- Multiple search terms or phrases containing whitespaces can be provided via the Advanced Search view.

user

• User object for user initiating search.

search_type

• The type of object to search for (string, optional).

- Used to restrict search to specific types of objects.
- You can specify supported types in the plugin's search_types list.
- Examples: file, sample..

keywords

- Special search keywords, e.g. "exact".
- NOTE: Currently not implemented.

Note: Within this function, you are expected to verify appropriate access of the seaching user yourself!

Warning: The old expected signature of providing a single search_term argument has been deprecated in v0.9 and will be removed in the next major release!

The return data is a dictionary, which is split by groups in case your app can return multiple different lists for data. This is useful where e.g. the same type of HTML list isn't suitable for all returnable types. If only returning one type of data, you can just use e.g. all as your only category. Example of the result:

Search Template

Projectroles will provide your template context the search_results object, which corresponds to the result dict of the aforementioned function. There are also includes for formatting the results list, which you are encouraged to use.

Example of a simple results template, in case of a single all category:

```
{% if search_results.all.items|length > 0 %}
    {# Include standard search list header here #}
    {% include 'projectroles/_search_header.html' with search_title=search_results.all.
...title result_count=search_results.all.items|length %}
    {# Set up a table with your results #}

    </th
```

(continues on next page)

(continued from previous page)

5.17.11 API Views

API view usage in project apps is detailed in this section.

Rest API Views

To set up REST API views for project apps, it is recommended to use the base SODAR API view classes and mixins found in projectroles.views_api. These set up the recommended authentication methods, versioning through accept headers and project-based permission checks.

By default, the REST API views built on SODAR Core base classes support two methods of authentication: Knox tokens and Django session auth. These can of course be modified by overriding/extending the base classes.

For versioning we strongly recommend using accept header versioning, which is what is supported by the SODAR Core base classes. For this, supply your custom media type and version data using the corresponding SODAR_API_* settings. For details on these, see *Projectroles Django Settings*.

The base classes provide permission checks via SODAR Core project objects similar to UI view mixins.

Base REST API classes without a project context can also be used in site apps.

See the base REST API class documentation for details on the base REST API classes.

An example "hello world" REST API view for SODAR apps is available in example_project_app.views. HelloExampleProjectAPIView.

Note: Internal SODAR Core REST API views, specifically ones used in apps provided by the django-sodar-core package, use different media type and versioning from views to be implemented on your site. This is to prevent version number clashes and not require changes from your API when SODAR Core is updated.

For implementing your own API views, make sure to use the SODARAPI* base classes, **not** the CoreAPI classes. Similarly, in testing make sure to use the base class helpers of the site API instead of the core API.

Ajax API Views

To set up Ajax API views for the UI, it is recommended to use the base Ajax view classes found in projectroles. views_ajax. These views only support Django session authentication by default, so Knox token authentication will not work. Versioning is omitted. Base views without project permission checks can also be used in site apps.

If you want to enable anonymous access to an Ajax API view when PROJECTROLES_ALLOW_ANONYMOUS is enabled in your site's Django settings, you can use the allow_anonymous property of the view.

See the base AJAX API view documentation for more information on using these base classes.

Example:

```
from projectroles.views_api import SODARBaseProjectAjaxView
class ExampleAjaxAPIView(SODARBaseProjectAjaxView):
permission_required = 'projectroles.view_project'
def get(self, request):
    # ...
```

Serializers

Base serializers for SODAR Core based API views are available in projectroles.serializers. They provide Project context where needed, as well as setting default fields such as sodar_uuid which should be always used in place of pk.

See the serializer API documentation for details on using base serializer classes.

5.17.12 Removing a Project App

Removing a project app from your Django site can be slightly more complicated than removing a normal non-SODARsupporting Django application. Following the procedure detailed here you are able to cleanly remove a project app which has been in use on your site.

The instructions apply to project apps you have created yourself as well as project apps included in the django-sodarcore package, with the exception of projectroles which can not be removed from a SODAR based site.

Warning: Make sure to perform these steps in the order they are presented here. Otherwise you may risk serious problems with your site functionality or your database!

Note: Just in case, it is recommended to make a backup of your Django database before proceeding.

First you should delete all Timeline references to objects in your app. This is not done automatically as, by design, the references are kept even after the original objects are deleted. Go to the Django shell via management command using shell or shell_plus and enter the following. Replace app_name with the name of your application as specified in its ProjectAppPlugin.

```
from timeline.models import ProjectEvent
ProjectEvent.objects.filter(app='app_name').delete()
```

Next you should delete existing database objects defined by the models in your app. This is also most easily done via the Django shell. Example:

```
from yourapp.models import YourModel
YourModel.objects.all().delete()
```

After the objects have been deleted, reset the database migrations of your application.

```
$ ./manage.py migrate yourapp zero
```

Once this has been executed successfully, you should delete the plugin object for your application. Returning to the Django shell, type the following:

```
from djangoplugins.models import Plugin
Plugin.objects.get(name='app_name').delete()
```

Finally, you should remove the references to the removed app in the Django configuration.

App dependency in config/settings/base.py:

```
LOCAL_APPS = [
# The app you are removing
'yourapp.apps.YourAppConfig',
# ...
]
```

App URL patterns in config/urls.py:

```
urlpatterns = [
    # Your app's URLs
    url(r'^yourapp/', include('yourapp.urls')),
    # ...
]
```

Once you have performed the aforementioned database operations and deployed a version of your Django site with the application dependency and URL patterns removed, the project app should be cleanly removed from your site.

5.18 Site App Development

This document details instructions and guidelines for developing site apps to be used with the SODAR Core framework.

It is recommended to read Project App Development before this document.

5.18.1 Site App Basics

Site apps are basically normal Django apps **not** intended to be used with a single SODAR project, such as site-level administrator apps. They provide certain features to be used in a SODAR-enabled Django site:

- Rules for accessing app data (similar to project apps but without the need for being associated with a project).
- Dynamic inclusion into the site and default templates via plugins.
- The ability to show site-wide messages to users.

5.18.2 Prerequisites

See Project App Development.

5.18.3 Models

No specific model implementation is required. However, it is strongly to refer to objects using sodar_uuid fields instead of the database private key.

5.18.4 Rules File

Generate a rules.py file similar to a project app. However, you should not use project predicates in this one. Example:

```
import rules
# Allow viewing data
rules.add_perm('{APP_NAME}.view_data', rules.is_authenticated)
```

If you allow anonymous users on your site and want to enable anonymous access to your site app, use the is_allowed_anonymous predicate:

```
from projectroles import rules as pr_rules
rules.add_perm(
    '{APP_NAME}.view_data',
    rules.is_authenticated | pr_rules.is_allowed_anonymous
)
```

5.18.5 SiteAppPlugin

Create a file plugins.py in your app's directory. In the file, declare a SiteAppPlugin class implementing projectroles.plugins.SiteAppPluginPoint. Within the class, implement member variables and functions as instructed in comments and docstrings.

```
from projectroles.plugins import SiteAppPluginPoint
from .urls import urlpatterns

class SiteAppPlugin(SiteAppPluginPoint):
    """Plugin for registering a site-wide app"""
    name = 'example_site_app'
    title = 'Example Site App'
    urls = urlpatterns
    # ...
```

The following variables and functions are **mandatory**:

name

App name. In most cases this should match the app package name.

title

Printable app title.

urls

Urlpatterns, usually imported from the app's urls.py file.

icon

Iconify collection and icon name (e.g. mdi:home).

entry_point_url_id

View ID for the app entry point.

description

Verbose description of the app.

app_permission

Basic permission for viewing app data in project (see above).

Implementing the following is **optional**:

app_settings

Implement if project or user specific settings for the app are needed. See the plugin point definition for an example.

info_settings

List of names for app-specific Django settings to be displayed for administrators in the siteinfo app.

get_messages()

Implement if your site app needs to display site-wide messages for users.

get_statistics()

Return statistics for the siteinfo app. See details in the siteinfo documentation.

get_object_link()

Return object link for a Timeline event.

get_extra_data_link()

Return extra data link for a Timeline event.

5.18.6 Views

In your views, you can still use projectroles mixins which are *not* related to projects. Especially LoggedInPermissionMixin is useful to ensure users not allowed to access a view are properly redirected. Example:

```
from django.views.generic import TemplateView
from projectroles.views import LoggedInPermissionMixin
class ExampleView(LoggedInPermissionMixin, TemplateView):
```

```
"""Site app example view"""
permission_required = 'example_site_app.view_data'
template_name = 'example_site_app/example.html'
```

Note: The entry point URL is not expected to have any URL kwargs in the current implementation. If you intend to use a view which makes use of URL kwargs, you may need to modify it into also accepting a request without any parameters (e.g. displaying default content for the view).

5.18.7 Templates

It is recommended for you to extend projectroles/base.html and put your actual app content within the projectroles block. Example:

```
{# Projectroles dependency #}
{% extends 'projectroles/base.html' %}
{% load projectroles_common_tags %}
{% block title %}
 Example Site App Page Title
{% endblock title %}
{% block projectroles %}
 <div class="container sodar-subtitle-container">
   <h2>
      <i class="iconify" data-icon="mdi:rocket-launch-outline"></i>
     Example Site App
   </h2>
 </div>
 <div class="container-fluid sodar-page-container">
   <div class="alert alert-info">
      This is an example and the entry point for <code>example_site_app</code>.
    </div>
 </div>
{% endblock projectroles %}
```

5.18.8 Site App Messages

The site app provides a way to display certain messages to users. For this, you need to implement get_messages() in the SiteAppPlugin class.

If you need to control e.g. which user should see the message or removal of a message after showing, you need to implement relevant logic in the function.

Example:

```
def get_messages(self, user=None):
    """
    Return a list of messages to be shown to users.
    :param user: User object (optional)
    :return: List of dicts or and empty list if no messages
    """
    return [{
        'content': 'Message content in here, can contain html',
        'color': 'info',  # Corresponds to bg-* in Bootstrap
        'dismissable': True  # False for non-dismissable
        'require_auth': True  # Only view for authorized users
    }]
```

5.19 Backend App Development

This document details instructions and guidelines for developing **backend apps** to be used with the SODAR Core framework.

It is recommended to read Project App Development before this document.

5.19.1 Backend App Basics

Backend apps are intended to be used by other apps via their plugin without requiring hard-coded imports. They may provide their own views for e.g. Ajax API functionality, but mostly they're intended to be internal "helper" apps as the name suggests.

5.19.2 Prerequisites

See Project App Development.

5.19.3 Models

No specific model implementation is required. However, it is strongly to refer to objects using sodar_uuid fields instead of the database private key.

5.19.4 BackendAppPlugin

The plugin is detected and retrieved using a BackendAppPlugin.

Declaring the Plugin

Create a file plugins.py in your app's directory. In the file, declare a BackendAppPlugin class implementing projectroles.plugins.BackendPluginPoint. Within the class, implement member variables and functions as instructed in comments and docstrings.

```
from projectroles.plugins import BackendPluginPoint
from .urls import urlpatterns

class BackendAppPlugin(BackendPluginPoint):
    """Plugin for registering a backend app"""
    name = 'example_backend_app'
    title = 'Example Backend App'
    urls = urlpatterns
    # ...
```

The following variables and functions are **mandatory**:

name

App name. In most cases this should match the app package name.

title

Printable app title.

icon

Iconify collection and icon name (e.g. mdi:home).

description

Verbose description of the app.

get_api()

Method for retrieving the API class for the backend. The user should implement this API class to be retrieved.

Implementing the following is optional:

javascript_url

Path to on demand includeable Javascript file.

css_url

Path to on demand includeable CSS file.

info_settings

List of names for app-specific Django settings to be displayed for administrators in the siteinfo app.

get_statistics()

Return statistics for the siteinfo app. See details in the siteinfo documentation.

get_object_link()

Return object link for a Timeline event.

get_extra_data_link()

Return extra data link for a Timeline event.

Hint: If you want to implement a backend API which is closely tied to a project app, there's no requirement to declare your backend as a separate Django app. You can just include the BackendAppPlugin in your app's plugins.py along with your ProjectAppPlugin. See the *timeline app* for an example of this.

Using the Plugin

To retrieve the API for the plugin, use the function projectroles.plugins.get_backend_api() as follows:

```
from projectroles.plugins import get_backend_api
example_api = get_backend_api('example_backend_app')
if example_api:  # Make sure the API is there, and only after that..
    pass  # ..do stuff with the API
```

Including Backend Javascript/CSS

If you want Javascript or CSS files to be associated with your plugin you can set the javascript_url or css_url variables to specify the path to your file. Note that these should correspond to STATIC paths under your app directory.

```
class BackendPlugin(BackendPluginPoint):
    name = 'example_backend_app'
    title = 'Example Backend App'
    javascript_url = 'example_backend_app/js/example.js'
    css_url = 'example_backend_app/css/example.css'
```

The get_backend_include template-tag will return a <script> or <link> html tag with your specific file path, to be used in a template of your app making use of the backend plugin:

```
{% load projectroles_common_tags %}
{% get_backend_include 'example_backend_app' 'js' as javascript_include_tag %}
{{ javascript_include_tag | safe }}
{% get_backend_include 'example_backend_app' 'css' as css_include_tag %}
{{ css_include_tag | safe }}
```

This will result in the following HTML:

```
<script type="text/javascript" src="/static/example.js"></script>
<link rel="stylesheet" type="text/css" href="/static/example.css"/>
```

Be sure to use the backend plugin's name (not the title) as the key and filter the result by safe, so the tag won't be auto-escaped.

5.20 General Resources

Via the projectroles app, SODAR Core provides optional features, APIs and templates for common functionality and layout regardless of the app type. These resources are described in this document.

5.20.1 Icons

To use icons in your apps, use the iconify class along with the collection and icon name into the data-icon attribute. See Iconify and django-iconify documentation for further information.

Example:

<i class="iconify" data-icon="mdi:home"></i>

Also make sure to modify the icon attribute of your app plugins to include the full collection:name syntax for Iconify icons.

In certain client side Javascript implementations in which icons are loaded or replaced dynamically, you may have to refer to these URLs as a direct img element:

For modifiers such as color and size when using img tags, see here.

SODAR Core uses the Material Design Icons collection for its own apps. You can also use additional collections supported by Iconify on your site by retrieving them with the geticons management command. Multiple collections can be downloaded with a single command, as seen in the example below. Make sure to run collectstatic after this command.

```
$ ./manage.py geticons -c collection1 collection2
$ ./manage.py collectstatic
```

5.20.2 Forms

This section contains guidelines for implementing forms.

Form Base Classes

Although not required, it is recommended to use common SODAR Core base classes with built-in helpers for your Django forms. SODARForm and SODARModelForm extend Django's Form and ModelForm respectively. These base classes can be imported from projectroles.forms. Currently they add logging to add_error() calls, which helps administrators track form issues encountered by users. Further improvements are to be added in the future.

SODAR User Selection Field

Projectroles offers a custom field, widget and accompanying Ajax API views for autocomplete-enabled selection of SODAR users in Django forms. The field will handle providing appropriate choices according to the view context and user permissions, also allowing for customization.

The recommended way to use the built-in user form field is by using the SODARUserChoiceField class found in projectroles.forms. The field extends Django's ModelChoiceField and takes most of the same keyword arguments in its init function, with the exception of queryset, to_field_name, limit_choices_to and widget which will be overridden.

The init function also takes new arguments which are specified below:

- scope: Scope of users to include (string)
 - all: All users on the site
 - project: Limit search to users in given project
 - project_exclude Exclude existing users of given project
- project: Project object or project UUID string (optional)
- exclude: List of User objects or User UUIDs to exclude (optional)
- forward: Parameters to forward to autocomplete view (optional)
- url: Autocomplete ajax class override (optional)
- widget_class: Widget class override (optional)

Below is an example of the classes usage. Note that you can also define the field as a form class member, but the project or exclude values are not definable at that point. The following example assumes you are setting up your project app form with an extra project argument.

```
from projectroles.forms import SODARUserChoiceField

class YourForm(forms.ModelForm):
    class Meta:
        # ...
    def __init__(self, project, *args, **kwargs):
        # ...
        self.fields['user'] = SODARUserChoiceField(
            label='User',
            help_text='Select user for your thing here',
            required=True,
            scope='project',
```

(continues on next page)

(continued from previous page)

```
project=project,
exclude=[unwanted_user]
```

For more examples of usage of this field and its widget, see projectroles.forms. If the field class does not suit your needs, you can also retrieve the related widget to your own field with projectroles.forms.get_user_widget().

To provide required Javascript and CSS includes for DAL in your form, make sure to include form.media in your template. Example:

```
<div class="container-fluid sodar-page-container">
<form method="post">
{{ form.media }}
{{ form | crispy }}
{% ... %}
</form>
</div>
```

If using customized Javascript for your widget, the corresponding JS file can be provided in the javascript block. See the django-autocomplete-light documentation for more information on how to customize your widget.

Markdown

)

For fields supporting markdown, it is recommended to use the SODARPagedownWidget found in projectroles. models.

5.20.3 App Setting API

For accessing and modifying app settings for project or site apps, you should use the AppSettingAPI. Below is an example of invoking the API. For the full API docs, see *Projectroles Django API Documentation*.

```
from projectroles.app_settings import AppSettingAPI
app_settings = AppSettingAPI()
app_settings.get_app_setting('app_name', 'setting_name', project_object) # Etc..
```

See the app settings API documentation for detailed instructions for using the API.

5.20.4 Pagination Template

A common template for adding navigation for list pagination can be found in projectroles/_pagination.html. This can be included to any Django ListView template which provides the paginate_by definition, enabling pagination. If a smaller layout is desired, the pg_small argument can be used. An example can be seen below:

{% include 'projectroles/_pagination.html' with pg_small=True %}

5.20.5 Tour Help

SODAR Core uses Shepherd to present an optional interactive tour for a rendered page. To enable the tour in your template, set it up inside the javascript template block. Within an inline javascript strucure, set the tourEnabled variable to true and add steps according to the Shepherd documentation.

Example:

```
{% block javascript %}
 {{ block.super }}
 {# Tour content #}
 <script type="text/javascript">
   tourEnabled = true;
   /* Normal step */
   tour.addStep('id_of_step', {
       title: 'Step Title',
       text: 'Description of the step',
       attachTo: '#some-element top',
       advanceOn: '.docs-link click',
       showCancelLink: true
   });
   /* Conditional step */
   if ($('.potentially-existing-element').length) {
       tour.addStep('id_of_another_step', {
            title: 'Another Title',
            text: 'Another description here',
            attachTo: '.potentially-existing-element right',
            advanceOn: '.docs-link click',
            showCancelLink: true
       });
   }
 </script>
{% endblock javascript %}
```

Warning: Make sure you call {{ block.super }} at the start of the declared javascript block or you will overwrite the site's default Javascript setup!

5.20.6 Project Modifying API

If your site needs to perform specific actions when projects are created or modified, or when project membership is altered, you can implement the project modifying API in your app plugin. This can be useful if your site e.g. maintains project data and access in other external databases or needs to set up some specific data on project changes.

Note: This API is intended for special cases. If you're unsure why you wouldn't need it on your site, it is possible you don't. Using it unnecessarily might complicate your site implementation.

This API works for *project apps* and *backend apps*. To use it, it is recommend to include the **ProjectModifyPluginMixin** in your plugin class and implement the methods relevant to your site's needs. An example of this can be seen below.

```
from projectroles.plugins import ProjectModifyPluginMixin

class ProjectAppPlugin(ProjectModifyPluginMixin, ProjectAppPluginPoint):
    # ...
    def perform_project_modify(
        self,
        project,
        action,
        project_settings,
        old_data=None,
        old_settings=None,
        request=None,
    ):
        pass # Your implementation goes here
```

You will also need to set PROJECTROLES_ENABLE_MODIFY_API=True in your site's Django settings to enable calling this API.

Project modification operations will be cancelled and reverted if errors are encountered at any point in the project modify API calls. If your site has multiple apps implementing this API, you should also implement reversion methods for each operations to assert a clean rollback. These methods are also included in the class.

You can control the order of the apps in which this API is called by listing your plugins in the PROJECTROLES_MODIFY_API_APPS Django setting. This will also affect the order of reversing.

To synchronize data for existing projects in development, you can implement the perform_project_sync() method.

5.20.7 Management Command Logger

When developing management commands for your apps, you may want to log certain events while also ensuring relevant output is provided to the administrator issuing a command. For this SODAR Core provides the ManagementCommandLogger class. It can be called like the standard Python logger with shortcut commands such as info(), debug() etc. If you need to access the actual Python logger being used, you can access it via ManagementCommandLogger.logger. Example of logger usage can be seen below.

```
from projectroles.management.logging import ManagementCommandLogger
logger = ManagementCommandLogger(__name__)
logger.info('Testing')
```

Note: The use of this logger class assumes your site sets up logging similarly to the example site and the SODAR Django Site template, including the use of a LOGGING_LEVEL Django settings variable.

Hint: To disable redundant console output from commands using this logger in e.g. your site's test configuration, you can set the LOGGING_DISABLE_CMD_OUTPUT Django setting to True.

5.20.8 Testing

SODAR Core provides a range of ready made testing classes and mixins for different aspects of SODAR app testing, from user permissions to UI testing. See projectroles.tests for different base classes.

Test Settings

SODAR Core provides settings for configuring your UI tests, if using the base UI test classes found in projectroles. tests.test_ui. Default values for these settings can be found in config/settings/test.py. The settins are as follows:

- PROJECTROLES_TEST_UI_CHROME_OPTIONS: Options for Chrome through Selenium. Can be used to e.g. enable/disable headless testing mode.
- PROJECTROLES_TEST_UI_WINDOW_SIZE: Custom browser window size.
- PROJECTROLES_TEST_UI_WAIT_TIME: Maximum wait time for UI test operations
- PROJECTROLES_TEST_UI_LEGACY_LOGIN: If set True, use the legacy UI login and redirect function for testing with different users. This can be used if e.g. issues with cookie-based logins are encountered.

Base Test Classes and Helpers

For base classes and mixins with useful helpers, see the projectroles.tests modules. The test cases also provide useful examples on how to set up your own tests.

Note: For REST API testing, SODAR Core uses separate base test classes for the internal SODAR Core API, and the API views implemented in the actual site built on SODAR Core. For the API views in your site, make sure to test them using e.g. TestAPIViewsBase and **not** TestCoreAPIViewsBase.

5.20.9 Debugging

Debugging helpers and tips are detailed in this section.

Profiling Middleware

SODAR Core provides a cProfile using profiler for tracing back sources of page loading slowdowns. To enable the profiler middleware, include projectroles.middleware.ProfilerMiddleware in MIDDLEWARE under your site configuration. It is recommended to use a settings variable for this similar to the example site configuration, where PROJECTROLES_ENABLE_PROFILING controls this.

Once enabled, adding the **?prof** query string attribute to and URL displays the profiling information.

5.21 General Guidelines

Below you can find general development guidelines for putting together your SODAR Core based site.

- We recommend following best practices from Two Scoops where applicable.
- To maintain consistency, app packages should be named without delimiting characters, e.g. projectroles and userprofile.
- It is recommended to add a "*Projectroles dependency*" comment when directly importing e.g. mixins or tags from the projectroles app.
- Hard-coded imports from apps *other than* projectroles should in most cases be avoided. Instead of hard imports, you should use the plugin structure. This helps maintain the possibility to dynamically include or exclude applications. See the example_backend_app for an example.
- Using Bootstrap 4 classes together with SODAR specific overrides and extensions provided in projectroles. js is recommended. A full layout style guide will be provided in the future.
- It is strongly recommended to pin your site's dependencies, including the django-sodar-core package, to a specific version number. Breaking changes may occur unexpectedly in projects of this scale and pulling latest versions of dependencies upon e.g. deployment may result in unexpected behaviour or errors.

5.22 SODAR Core Development

This section contains instructions and guidelines for contributing to the development of the SODAR Core package.

For developing apps to use in your own SODAR Core based site, see Site Development.

5.23 Contributing

Contributions to the SODAR Core package are welcome and they are greatly appreciated! Every little bit helps, and credit will always be given. You can contribute in many ways detailed in the following subsection.

5.23.1 Types of Contributions

Report Bugs

Report bugs through the SODAR Core issue tracker in GitHub.

When reporting a bug, please follow the provided template. Make sure to include the following information:

- Your operating system name and version.
- Any details about your local setup that might be helpful in troubleshooting.
- Detailed steps to reproduce the bug.

Fix Bugs

Look through the issue tracker for bugs. Anything tagged with bug and help wanted is open to whoever wants to implement it.

Implement Features

Look through the issue tracker for features. Anything tagged with feature and help wanted is open to whoever wants to implement it.

Write Documentation

SODAR Core can always use more documentation, whether as part of the official SODAR Core docs, in docstrings, or even on the web in blog posts, articles, and such.

For contributing to the official documentation, see Documentation Guidelines.

For editing docstrings, see Code Conventions.

Submit Feedback

The best way to send feedback is to file an issue in the issue tracker.

If you are proposing a feature:

- Follow the provided template.
- Explain in detail how it would work.
- Keep the scope as narrow as possible, to make it easier to implement.
- Separate multiple suggestions into separate issues, avoiding "umbrella tickets" and ensuring simple assignment and follow-up.
- Remember that this is a volunteer-driven project, and that contributions are welcome :)

5.23.2 Get Started

Ready to contribute code to SODAR Core? Here are the steps to get started.

- 1. Fork the sodar-core repo on GitHub.
- 2. Clone your fork locally.

\$ git clone git@github.com:your_name_here/sodar-core.git

- 3. Set up SODAR Core for development. For instructions see Development Installation.
- 4. Create a branch for local development. Make sure to base it on the dev branch. You can now make your changes locally.

\$ git checkout -b 123-branch-name dev

5. When you're done making changes, make sure to apply proper formatting using Black. Next, check linting with flake8. Finally, run the tests.:

```
$ make black
$ flake8 .
$ make test
```

6. Once flake8 and tests, commit your changes and push your branch to GitHub.

```
$ git add .
$ git commit -m "add/update/fix issue-description-here (#issue-id)"
$ git push origin 123-branch-name
```

7. Submit a pull request through the GitHub website.

For specific requirements and recommendations on work branches, commits and pull requirements, see *SODAR Core Development Guidelines*.

For guidelines regarding the code itself, see *Code Conventions*.

5.24 Code of Conduct

Everyone interacting in the SODAR Core project's codebases, issue trackers, chat rooms, and mailing lists is expected to follow the PyPA Code of Conduct.

5.25 Development Installation

Instructions on how to install a local development version of SODAR Core are detailed here. Ubuntu 20.04 LTS (Focal) is the supported OS at this time. Later Ubuntu versions and Centos 7 have also been proven to to work, but some system dependencies may vary for different OS versions or distributions.

Installation and development should be possible on most recent versions of Linux, Mac and Windows (WSL2 recommended). However, this may require extra work and your mileage may vary.

If you need to set up the accompanying example site in Docker, please see online for up-to-date Docker setup tutorials for Django related to your operating system of choice.

Note: These instructions are also valid for the sodar-django-site repository.

5.25.1 System Dependencies

To get started, install the OS dependencies, PostgreSQL >=11 and Python >=3.8.

```
$ sudo utility/install_os_dependencies.sh
```

```
$ sudo utility/install_python.sh
```

\$ sudo utility/install_postgres.sh

5.25.2 Database Setup

Next you need to setup the database and postgres user. You'll be prompted to enter a database name, a username and a password.

\$ sudo utility/setup_database.sh

You have to set the database URL and credentials for Django in the environment variable DATABASE_URL. For development it is recommended to place environment variables in file .env located in your project root. To enable loading the file in Django, set DJANGO_READ_DOT_ENV_FILE=1 in your environment variables when running SODAR or any of its management commands. See config/settings/base.py for more information and the env.example file for an example environment file.

Example of the database URL variable as set within an .env file:

```
DATABASE_URL=postgres://your-db:your-db@127.0.0.1/your-db
```

5.25.3 Repository and Environment Setup

Clone the repository, setup and activate the virtual environment. Once within the repository and an active virtual environment, install Python requirements for the project. Example:

```
$ python3.x -m venv .venv
$ source .venv/bin/activate
$ utility/install_python_dependencies.sh
```

5.25.4 LDAP Setup (Optional)

If you will be using LDAP/AD auth on your site, make sure to also run:

```
$ sudo utility/install_ldap_dependencies.sh
$ pip install -r requirements/ldap.txt
```

5.25.5 Final Setup

Initialize the database (this will also synchronize django-plugins):

\$./manage.py migrate

Create a Django superuser for the example site:

```
$ ./manage.py createsuperuser --skip-checks --username admin
```

Run the geticons and collectstatic commands to download and enable Iconify icons:

```
$ ./manage.py geticons
$ ./manage.py collectstatic
```

You are now able to run the server:

\$ make serve

5.26 SODAR Core Development Guidelines

This subsection lists specific conventions and guidelines for contributing code or documentation to SODAR Core.

5.26.1 Work Branches

Make sure to base your work branch on the dev branch. This branch is used for development and is always the latest "bleeding edge" version of SODAR Core. The main branch is only used for merging stable releases.

When naming your work branches, prefix them with the issue name, e.g. 123-your-new-feature or 123-bug-being-fixed. It is recommended to keep the branch names short and concise.

5.26.2 Commits

It is recommended to use short but descriptive commit messages and always include the related issue ID(s) in the message. Examples:

- add local irods auth api view (#1263)
- fix ontology column config tooltip hiding (#1379)

5.26.3 Pull Requests

Please add the related issue ID(s) to the title of your pull request and ensure the pull request is set against the dev branch.

Before submitting a pull request for review, ensure the following:

- You have followed code conventions (see *Code Conventions*).
- You have updated existing tests and/or written new tests as applicable (see *Testing Conventions*).
- You have updated documentation if your pull requests adds or modifies features (see *Documentation*).
- make black has been run for the latest commit.
- flake8 . produces no errors.
- All tests pass with make test.

Your pull request should work on the Python versions currently supported by the SODAR Core dev version. These will be checked by GitHub Actions CI upon pushing your commit(s).

5.26.4 Code Conventions

The following conventions should be adhered to in SODAR Core development:

- Limit line length to 80 characters.
 - Exception: Docstrings for REST API endpoint methods.
 - Exception: Documentation syntax where this can not be avoided, e.g. long references in RST.
- Use single quotes instead of double quotes for variables.
 - Black does not enforce this, so they have to be ensured manually.
- Do not use RST syntax in docstrings or comments.

- Exception: Docstrings for REST API endpoint methods.
- No type hints should be used at the moment.
 - Possibility to expand the entire project into using type hints will be looked into.

5.26.5 Testing Conventions

The following conventions should be followed when writing tests for your code commits:

- Use common base classes and helpers from projectroles.tests.* where applicable.
- Update existing tests according to your changes.
- Add new tests for new features or cases where tests are missing.
- Always add tests for the following components:
 - Models
 - Views (UI, Ajax and REST)
 - Custom plugin methods
 - Management commands
- For views, add permission tests and view tests.
- Separate tests for forms are not necessary, they should go under UI view tests.
- Similarly, tests for serializers can be contained within API view tests.
- Add Selenium UI tests for any relevant changes in the UI logic, templates and JQuery.

5.26.6 Documentation

Documentation of SODAR Core is in the ReStructuredText (RST) format. It is compiled using Sphinx with the Readthedocs theme. Please follow formatting conventions displayed in existing documentation. A full style guide will be provided later.

Static assets should be placed under docs/source/_static/document_name/.

Once you have finished your edits, build the documentation to ensure no warnings or errors are raised. You will need to be in your virtual environment with Sphinx and other requirements installed.

\$ cd	docs			
\$ mai	ke html			

Note that in some cases such as editing the index, changes may not be visible unless you build the docs from scratch. In that case, first remove previously built files with rm -rf build.

When updating the CHANGELOG file, the following conventions should be followed:

- Split updates into the Added/Changed/Fixed/Removed categories.
- Under each category, mark updates under the related app if applicable, otherwise use General.
- Write brief but descriptive descriptions followed by issue ID(s). Previous entries serve as examples.

5.27 SODAR Core Development Resources

This document details instructions and guidelines for development of the SODAR Core package.

5.27.1 App Development

Guidelines for developing **internal** SODAR Core apps (ones included when installing the django-sodar-core package) are detailed in this section.

For the most part, developing apps within the SODAR Core package follow the same guidelines as detailed in *Site Development*. However, there are certain exceptions.

REST API Views

For internal SODAR Core apps, you need to use core counterparts to the mixins than provided for SODAR Core using sites. The counterparts use different media type and versioning from views to be implemented on external sites. This is to prevent version number clashes requiring changes in external APIs. The classes can be found in projectroles. views_api and are as follows:

- CoreAPIVersioning
- CoreAPIRenderer
- CoreAPIBaseMixin
- CoreAPIBaseProjectMixin
- CoreAPIGenericProjectMixin

For detailed API descriptions, see docstrings in the view_api module. The media type and versioning for these views are **hardcoded** and should not be changed, except version information upon a new release of SODAR Core.

5.27.2 Projectroles App Development

This section details issues regarding updates to the projectroles app.

Warning: As all other apps in SODAR Core as well as sites implementing SODAR Core are based on projectroles, changes to this app need to be implemented and tested with extra care. Also make sure to provide detailed documentation for all breaking changes.

Projectroles App Settings

Projectroles defines its own app settings in projectroles/app_settings.py. These are not expected to be altered by SODAR Core based sites. These settings add the local attribute, which allows/disallows editing the value on a TARGET site.

To alter projectroles app settings when developing the app, update the PROJECTROLES_APP_SETTINGS dictionary as follows:

```
'example_setting': {
    'scope': 'PROJECT', # PROJECT/USER
    'type': 'STRING', # STRING/INTEGER/BOOLEAN
    'default': 'example', 'example2'], # Optional, only for settings of type STRING or_
    options': ['example', 'example2'], # Optional, only for settings of type STRING or_
    options': ['example', 'example2'], # Optional, only for settings of type STRING or_
    options': ['example', 'example2'], # Optional, only for settings of type STRING or_
    options': ['example', 'example2'], # Optional, only for settings of type STRING or_
    options': ['example', 'example2'], # Optional, defaults to name/key
    'placeholder': 'Enter example setting here', # Optional
    'description': 'Example project setting', # Optional
    'user_modifiable': True, # Optional, show/hide in forms
    'local': False, # Allow editing in target site forms if True
}
```

5.27.3 Testing

To run unit tests, you have to install Chrome and Chromedriver followed by the Python test requirements:

```
$ sudo utility/install_chrome.sh
$ pip install -r requirements/test.txt
```

Now you can run all tests with the following make command:

\$ make test

If you want to only run a certain subset of tests, use e.g.:

```
$ make test arg=projectroles.tests.test_views
```

5.27.4 Remote Site Development

For developing remote site features, you will want to run two or more SODAR Core example sites concurrently: one SOURCE site and one or more TARGET sites.

For running a single TARGET site in addition to the main site, the fastest way to get started is the following:

First, set up a second database called sodar_core_target using utility/setup_database.sh.

Next, migrate the new database and create a superuser using make manage_target. It is recommended to use a different admin user name than on your SOURCE site, to help debugging.

```
$ make manage_target arg=migrate
$ make manage_target arg=createsuperuser
```

Launch your site with make serve_target. By default, you can access the site at Port 8001 on localhost. The port can be altered by providing the target_port parameter, e.g. make serve_target target_port=8002. Management commands to the target site can be issued with the make manage_target make command.

Due to how cookies are set by Django, you currently may have to relogin when switching to a different site on your browser. As a workaround you can launch one of the sites in a private/incognito window or use different browsers.

If you need to create multiple target sites for testing PEER synchronization features, make sure that you have a separate SODAR Core database for each site and launch each site on a different port on localhost. The configuration local_target2.py is included for developing with multiple TARGET sites.

5.28 Repository Contents

5.28.1 Directories

The following directories are included in the repository. These include internal SODAR Core apps, example apps, directories containing files for running the Django development site, as well as a CI and issue tracker setup.

.github

Files for GitHub Actions CI and issue templates.

adminalerts

Adminalerts App.

appalerts

Appalerts App.

bgjobs

Bgjobs App.

config

Example Django site configuration.

docs

This documentation.

example_backend_app

Example backend app.

example_project_app

Example project app.

example_site

Example Django site to be run in development.

example_site_app

Example site-wide app.

filesfolders

Filesfolders App.

projectroles

Projectroles App. The main application containing the base project management logic of SODAR Core, required to run a SODAR Core based site.

requirements

Requirements for SODAR Core and its development.

siteinfo

Siteinfo App.

sodarcache

Sodarcache App.

timeline

Timeline App.

tokens

Tokens App.

userprofile

Userprofile App.

utility

Setup scripts for development.

5.28.2 Files

Relevant files in the root of the repository are detailed here.

.gitlab-ci.yml

GitLab CI configuration, used on the internal CUBI GitLab server.

CHANGELOG.rst

Full changelog for the project.

env.example

Example .env file for development.

Makefile

Makefile used to run the server and tests during development along with other shortcuts.

manage.py

The Django file for running management commands.

README.rst

The project readme.

requirements.txt

Requirements file placed here for compatibility. Actual requirements can be found in requirements/*.txt.

setup.cfg

Settings for Flake8, Pycodestyle and Versioneer. Generally these should not be touched.

setup.py

The setup file for the django-sodar-core package.

versioneer.py

Versioneer file for maintaining the SODAR Core version.

5.29 Major Changes

This document details highlighted updates and breaking changes in SODAR Core releases. It is recommended to review these notes whenever upgrading from an older SODAR Core version. For a complete list of changes in current and previous releases, see the *full changelog*.

5.29.1 v0.11.1 (2023-01-09)

- Add support for models from other apps in project access URL kwargs
- Allow enabling project breadcrumb scrolling
- Fix timeline app issues
- · Fix repository and environment issues
- · General bug fixes and minor updates

System Prerequisites

The following minimum versions have been bumped:

- django>=3.2.16
- setuptools>=65.6.3, <65.7
- wheel>=0.38.4, <0.39

5.29.2 v0.11.0 (2022-09-23)

Release Highlights

- Remove taskflowbackend app
- Add project modifying API to replace built-in taskflowbackend
- Enable including custom content in the login view
- Upgrade general dependencies

Breaking Changes

Taskflowbackend Removed

This release of SODAR Core removes the taskflowbackend app. To our knowledge it has not been used in any other projects than SODAR itself. However, it is possible for the app to have been inadvertently enabled on your Django site, resulting in unexpected server errors once removed.

In case this happens, you need to first edit config/settings/base.py to remove taskflowbackend. apps.TaskflowbackendConfig from LOCAL_APPS. Also make sure taskflow is not included in the ENABLED_BACKEND_PLUGINS setting.

Next, run the Django shell and enter the following:

```
from djangoplugins.models import Plugin
Plugin.objects.get(name='taskflow').delete()
```

After this the server should run without issues.

Project.submit_status Removed

The submit_status field has been removed from the Project model, along with related helper method arguments and constants. This field was primarily used by SODAR Taskflow, but its removal may raise some issues in e.g. unit tests. If you encounter errors, refactor your code to remove references to the field.

REST API Backwards Compatibility

Due to some required changes to the REST API, it is no longer considered backwards compatible with older versions. Version 0.11.0 or higher must now be used. Note that target sites using a SODAR Core v0.11 source site also have to be updated for remote project sync to work.

Changes:

- Remove owner argument requirement from ProjectUpdateAPIView.
- Do not provide submit_status in ProjectListAPIView and ProjectRetrieveAPIView.

System Prerequisites

Changes in system requirements:

- PostgreSQL v11 is now the minimum recommended version of the database.
- The minimum Django version has been bumped to v3.2.15.
- General Python dependencies have been upgraded, see requirements/*.txt

User Autocomplete Fields Updated

The django-autocomplete-light dependency has been upgraded to v3.9, which comes with potential incompatibilities. If you include widgets using DAL in your site's views, you should upgrade them as follows:

- Remove DAL related JS and CSS includes from your template (not including any possible custom event listeners)
- Add {{ form.media }} to your template if not present.

For an example, see the roleassignment_form.html template.

Login Template Updated

The default login template login.html has been updated for including extended content via include/ _login_extend.html. If you have overridden the login template with your own, ensure to update it accordingly to enable this new functionality.

5.29.3 v0.10.13 (2022-07-15)

- Add support for Taskflow testing from a different host or Docker network
- Update contributing and development documentation
- Repository updates
- Bug fixes

System Prerequisites

The minimum Django version has been bumped to v3.2.14.

5.29.4 v0.10.12 (2022-04-19)

Release Highlights

- Add support for specifying plugin name for Timeline events
- Minor updates and optimization

Breaking Changes

System Prerequisites

The minimum Django version has been bumped to v3.2.13.

5.29.5 v0.10.11 (2022-03-22)

Release Highlights

- Add sidebar icon resizing
- Change project create form to require manual setting of project type
- Fix project visibility in project list for inherited owners
- · General bug fixes and minor updates

Breaking Changes

Search Result Context Data in Tests

In context data for ProjectSearchResultsView, the app_search_data dictionary has been renamed into app_results. This does not affect implementing the search functionality from your apps, but if you test that functionality by asserting search view output, you have to rename this dict in your test cases.

5.29.6 v0.10.10 (2022-03-03)

- Fix layout issues
- · Fix search issues
- General bug fixes and minor updates

N/A

5.29.7 v0.10.9 (2022-02-16)

Release Highlights

- Add anonymous access support for Ajax API views
- Update project list for client side loading
- Update timeline app status change retrieval and rendering
- Optimize project list queries
- General bug fixes and minor updates

Breaking Changes

N/A

5.29.8 v0.10.8 (2022-02-02)

Release Highlights

- Drop Python 3.7 support, add Python 3.10 support
- Display missing site settings in siteinfo app
- Fix project creation owner assignment for non-owner category members
- Improve layout in siteinfo and timeline apps
- Upgrade third party Python package dependencies
- Optimize queries in timeline app

Breaking Changes

System Prerequisites

SODAR Core no longer supports Python 3.7. Python 3.8 is currently both the minimum and default version to run SODAR Core and its dependencies.

Third party Python package dependencies have been upgraded. See the requirements directory for up-to-date package versions and upgrade your project accordingly.

Deprecated Selenium Methods

The minimum Selenium version has been upgraded to v4.0.x. Some test methods have been deprecated in this version and will be removed in a future releases. UI test helpers from this version onwards will use the non-deprecated versions. You should the dependency in your projects, run tests, check the output and update any deprecated method calls if used.

Timeline App API Updated

If you are using TimelineAPI.get_event_description() in your own apps, please note that the method signature has changed. This may affect the use of positional arguments.

5.29.9 v0.10.7 (2021-12-14)

Release Highlights

- Search bug fixes
- REST API project type restriction fixes
- · General bug fixes and minor updates
- Upgraded dependencies

Breaking Changes

System Prerequisites

The following minimum versions have been bumped:

- django>=3.2.10, <3.3
- python-ldap==3.4.0

API View Invalid Project Type Response

If project_type is set in a REST API view and that view is called with an disallowed value, the view will return HTTP 403 instead of 400. The cause for this response is included in the detail field.

5.29.10 v0.10.6 (2021-11-19)

- Add additional emails for users
- Add project type restriction for API views
- Add profiling middleware
- Improve management command output
- Improve user representation in email
- Optimize project list queries

- Timeline app bug fixes
- Search results layout fixes
- General bug fixes and minor updates
- Upgraded dependencies

System Prerequisites

The minimum Django version has been bumped to v3.2.9.

Search Results DataTables Upgrade

DataTables includes on the search results page have been upgraded to version bs4/dt-1.11.3/b-2.0.1. You are advised to review the search results layout for your own apps to ensure everything looks correct.

Project.has_public_children() Removed

The Project model has_public_children() helper has been removed. In its place, you should use the Project. has_public_children field.

5.29.11 v0.10.5 (2021-09-20)

Release Highlights

- Display project badge in app alerts
- Custom email header and footer
- Fix remote sync of non-projectroles app settings
- Multiple app settings remote sync bug fixes
- · General bug fixes and minor updates
- Upgraded dependencies

Breaking Changes

System Prerequisites

The minimum Django version has been bumped to v3.2.7.

Template Tag Removed

The get_plugin_name_by_id() template tag has been removed from projectroles_common_tags. There should be no reason to query app plugins by database ID. Please use e.g. the utilities found in projectroles.plugins instead.

5.29.12 v0.10.4 (2021-08-19)

Release Highlights

- Appalerts list view UI improvements
- Siteinfo app and UI improvements
- Fix API and UI views to return 404 status code if object is not found
- General bug fixes and minor updates
- Upgraded dependencies

Breaking Changes

System Prerequisites

The minimum Django version has been bumped to v3.2.6.

Base UI and API View 404 Responses

Base UI and API views have been fixed to correctly return HTTP 404 to authorized users for resources that are not found. This may affect some test cases which still operate under the assumption of the views returning 403 instead.

5.29.13 v0.10.3 (2021-07-01)

Release Highlights

- General bug fixes and minor updates
- Upgraded dependencies

Breaking Changes

System Prerequisites

The minimum Django version has been bumped to v3.2.5.

The following third party Python package requirements have been upgraded:

- sphinx-rtd-theme>=0.5.2, <0.6 (base)
- black==21.6b0 (test)

5.29.14 v0.10.2 (2021-06-03)

Release Highlights

- · Project list bug fixes
- General bug fixes and minor updates
- Upgraded dependencies
- Minor changes

Breaking Changes

System Prerequisites

The minimum Django version has been bumped to v3.2.4.

Third party Python package requirements have been upgraded. See the **requirements** directory for up-to-date package versions.

5.29.15 v0.10.1 (2021-05-06)

Release Highlights

- Add JQuery status updating for app alerts
- Make project available in PyPI
- Critical bug fixes for remote sync
- · Bug fixes and minor updates

Breaking Changes

System Prerequisites

The minimum versions of dependencies have been bumped as follows:

- Django: v3.2.1
- Django-debug-toolbar: v3.2.1

Base Template Updated

If you are overriding the base_site.html with your own template and intend to use the appalerts app, please add the following snippet into the javascript block in {SITE}/templates/base.html:

```
{% block javascript %}
  {# ... #}
  <!-- App alerts Javascript -->
  {% include 'projectroles/_appalerts_include.html' %}
  {% endblock javascript %}
```

Remote Sync Bug in v0.9

A bug in remote project sync was recently discovered in SODAR Core v0.9.x and v0.10.0. The bug has been fixed in this release, but the complete fix requires for both the SOURCE and TARGET sites to be upgraded to v0.10. If you need to use a site based on SODAR Core v0.9 as a remote sync target, please upgrade your site to this hotfix branch. Note that it is recommended to upgrade all your sites to v0.10 as soon as possible.

5.29.16 v0.10.0 (2021-04-28)

Release Highlights

- Project upgraded to Django v3.2
- Minimum Python version requirement upgraded to 3.7
- Site icons access via Iconify
- Material Design Icons used as default icon set
- Appalerts app for app-generated user alerts
- Site-wide timeline events
- Timeline events without user
- · Allow public guest access to projects for authenticated and anonymous users
- Display Django settings in Site Info app

Breaking Changes

System Prerequisites

Python version requirements have been upgraded as follows:

- The **minimum** Python version is 3.7
- The **recommended** Python version is 3.8
- CI tests are run on Python 3.7, 3.8 and 3.9
- Support for Python 3.6 has been dropped.

It is recommended to always use the most recent minor version of a Python release.

Third party Python package requirements have been upgraded. See the **requirements** directory for up-to-date package versions.

Ubuntu 20.04 Focal is now the recommended OS version for development.

Django v3.2 Upgrade

This release updates SODAR Core from Django v1.11 to v3.2. This is a breaking change which causes many updates and also requires updating several dependencies.

To upgrade, please update the Django requirement along with your site's other Python requirements to match ones in requirements/*.txt. See Django deprecation documentation for details about what has been deprecated in Django and which changes are mandatory.

Common known issues:

- Minimum version of PostgreSQL has been raised to v9.5.
- ForeignKey fields in models must explicitly declare an on_delete argument.
- is_authenticated() and is_anonymous() in the user model no longer work: use is_authenticated and is_anonymous instead.
- Replace imports from django.core.urlresolvers with django.urls.
- Replace django.contrib.postgres.fields.JSONField with django.db.models.JSONField.
- Add DEFAULT_AUTO_FIELD = 'django.db.models.AutoField' in config/settings/base.py to get rid of database migration warnings.
- Replace {% load staticfiles %} with {% load static %}.

In the future, the goal is to keep SODAR Core at the latest stable major version of Django, except for potential cases in which a critical third party package has not yet been updated to support a new release.

New Context Processors Required

The following new context processors are required if you intend to include any site apps to your projects, or make use of site-wide app alerts, respectively. To make use of these features, please add the following processors in base.py under TEMPLATES:

```
TEMPLATES = [
{
    'OPTIONS': {
        'context_processors': {
            # ...
            'projectroles.context_processors.site_app_processor',
            'projectroles.context_processors.app_alerts_processor',
            }
        }
    }
}
```

REST API Updates

The following changes have been made to REST API views:

• public_guest_access parameter added to project API views.

Site Icons Updated

Instead of directly including Font Awesome, site icons are now accessed as SVG using Iconify. The default icon set has been changed from Font Awesome to Material Design Icons. It is however possible to use other icon sets supported by Iconify for your own SODAR Core apps.

To make your icons work with SODAR Core v0.10+, you will need to take the following steps.

First, make sure django-iconify is installed. Add dj_iconify.apps.DjIconifyConfig to your Django site settings under THIRD_PARTY_APPS and dj_iconify.urls to your site URLs in config/urls.py. See SODAR Core or SODAR Django Site settings for an example.

You will also need to set ICONIFY_JSON_ROOT in the base Django settings.

ICONIFY_JSON_ROOT = os.path.join(STATIC_ROOT, 'iconify')

If you are overriding the base_site.html template, add the following lines to your base template:

Next, you must download the Iconify JSON collection files required for hosting the icons on your Django server. It is recommended to use the geticons management command for this. By default, this downloads the required collections.json file along with the mdi.json file for the MDI icon collection.

\$./manage.py geticons

If you wish to also use other collections than MDI, add them as a list using the -c argument. The following example downloads the additional carbon and clarity icon sets.

\$./manage.py geticons -c carbon clarity

Make sure you run collectstatic after retrieving the collections for development.

Before committing your code, it is recommended to update your .gitignore file with the following lines:

```
*/static/iconify/*.json
*/static/iconify/json/*.json
```

To make the icons in your apps work with this change, you must change the icon syntax in your Django templates. Use iconify as the base class of the icon element. Enter the collection and icon name into the data-icon attribute.

Example:

<i class="iconify" data-icon="mdi:home"></i>

Also make sure to modify the icon attribute of your app plugins to include the full collection:name syntax for Iconify icons.

You may have to specify icon sizing manually in certain elements. In that case, use the data-height and/or data-width attributes. For spinning icons, add the spin class provided in projectroles.css.

Once you have updated all your icons, you can remove the Font Awesome CSS include from your base template if you are not directly importing it from base_site.html.

In certain client side Javascript implementations in which icons are loaded or replaced dynamically, you may have to refer to these URLs as a direct img element:

For modifiers such as color and size when using img tags, see here.

Deprecated Features Removed

The following previously deprecated features have been removed in this release:

- Project.get_full_title() has been removed. Use Project.full_title instead.
- Old style search with a single search_term argument has been removed. Make sure your search implementation expects and uses a search_terms list instead.

Timeline API Changes

The signatures for get_object_url() and get_object_link() helpers have changed. They now expect the object itself as first argument, followed by an optional Project object. The same also applies for get_history_dropdown() in projectroles common template tags.

Public Guest Access Support

This version adds public guest access support for projects. By setting PROJECTROLES_ALLOW_ANONYMOUS true, this can be extended to anonymous users. For your views to properly support anonymous access, please use the override of LoginRequiredMixin provided in projectroles.views instead of the original mixin supplied in Django.

GitHub Repository Updates

The GitHub repository for the project has been renamed from sodar_core to sodar-core. Otherwise the URL remains the same: https://github.com/bihealth/sodar-core/

GitHub should redirect from the old name indefinitely. However, just to be sure it is recommend to update your site's dependencies.

Additionally, the former master branch has been renamed to main.

5.29.17 v0.9.1 (2021-03-05)

- · Add inline head include from environment variables in base template
- Duplicate object UUIDs in REST API view nested lists

Base Template Updated

The base site template in projectroles/base_site.html has been updated. If you have copied the template to your own site's base template to extend it, please make sure to copy the latest changes to maintain full compatibility. See diff between templates or search for lines containing inline_head_include.

Duplicate UUIDs in Nested REST API Lists

Nested object lists in SODAR Core REST API views are grouped into dictionaries using each object's sodar_uuid. From this version onwards, the UUID fields are duplicated within each object as well. While this isn't a breaking change in itself, if you use SODARNestedListSerializer it may cause some of your test cases to fail unless altered.

5.29.18 v0.9.0 (2021-02-03)

Release Highlights

- Last major update based on Django v1.11
- Enable modifying local app settings in project update form on target sites
- Add projectroles app settings
- Add remote sync for global projectroles app settings
- · Add IP address based access restriction for projects
- Add SSO support via SAML
- Add support for local user invites and local user account creation
- Add batch invites and role updates via management command
- Add REST API views for project invite management
- Add advanced search with multiple terms
- Add REST API view for current user info retrieval

Breaking Changes

Development Helper Scripts

Development helper scripts (.sh) have been replaced by a Makefile. Get an overview of the available commands via make usage.

System Prerequisites

Third party Python package requirements have been upgraded. See the **requirements** directory for up-to-date package versions.

The following third party JS/CSS requirements have been updated:

- JQuery v3.5.1
- Bootstrap v4.5.3

Note: This is the last major update of SODAR Core based on and supporting Django v1.11, which is now out of long term support. From v0.10 onwards, SODAR Core based sites must be implemented on Django v3.x+.

ProjectAppPlugin Search Updates

The expected signature for ProjectAppPluginPoint.search() has changed. Instead of the search_term string argument, search_terms is expected. This argument is a list of strings expected to be combined with OR operators.

See the filesfolders app for an example of the new implementation.

In SODAR Core v0.9, the old deprecated implementation still works, but searching for multiple terms in the "Advanced Search" view will only return results for the first search term given. This deprecation protection will be removed in the next major version. Please update the search() methods in your project app plugins if you have implemented them.

Project Full Title Field

The full title of a project, including the entire category path, can now be accessed via the Project.full_title. This enables you to use the field directly in your Django queries and ordering. The value of the field is auto-populated on Project.save() and in a database migration accompanied in this release.

As a result, the Project.get_full_title() has been deprecated and will be removed in the next major SODAR Core release. Please refactor your usage of that helper into referring to Project.full_title directly.

5.29.19 v0.8.4 (2020-11-12)

Release Highlights

This release updates documentation for JOSS submission.

Breaking Changes

N/A

5.29.20 v0.8.3 (2020-09-28)

Release Highlights

- Fix issues in remote project synchronization
- Fix crashes in siteinfo app from exceptions raised by plugins

Breaking Changes

Remote Project Sync and Local Categories

When working on a TARGET site, creating local projects under categories synchronized from a SOURCE site is no longer allowed. This is done to avoid synchronization clashes. If you want to enable local projects on your site in addition to remote ones, you will need to create a local root category for them.

API Changes

ProjectCreateAPIView now returns status 403 if called on a target site with disabled local projects, instead of 400 as before.

5.29.21 v0.8.2 (2020-07-22)

Release Highlights

- Enable site-wide background jobs
- Critical bug fixes for project member management
- Minor fixes and updates

Breaking Changes

N/A

5.29.22 v0.8.1 (2020-04-24)

- Fix checking for remote project status in projectroles REST API views
- Miscellaneous bug fixes

SODARAPIObjectInProjectPermissions Removed

The deprecated SODARAPIObjectInProjectPermissions base class has been removed from projectroles. views_api. Please base your REST API views to one of the remaining base classes instead.

5.29.23 v0.8.0 (2020-04-08)

Release Highlights

- Add API views for the projectroles and filesfolders apps
- · Add new base view classes and mixins for API/Ajax views
- Import the tokens API token management app from VarFish
- Allow assigning roles other than owner for categories
- Allow category delegates and owners to create sub-categories and projects
- Allow moving categories and projects under different categories
- · Inherit owner permissions from parent categories
- Allow displaying project apps in categories with category_enable
- Reorganization of views in apps

Breaking Changes

Owner Permissions Inherited from Categories

Starting in this version of SODAR Core, category owner permissions are automatically inherited by projects below those categories, as well as possible subcategories. If this does not fit your use case, it is recommend to reorganize your project structure and/or give category access to admin users who have access to all projects anyway.

Projectroles Views Reorganized

Views, base views related mixins for the projectroles app have been reorganized in this version. Please review your projectroles imports.

The revised structure is as follows:

- UI views and related mixins **remain** in projectroles.views
- Ajax API view classes were **moved** into projectroles.views_ajax
- REST API view classes moved into projectroles.views_api
- Taskflow API view classes **moved** into projectroles.views_taskflow

The same applies to classes and mxins in view tests. See projectroles.tests.test_views* to update imports in your tests.

Renamed Projectroles View Classes

In addition to reorganizing classes into different views, certain view classes intended to be usable by other apps have been renamed. They are listed below.

- UserAutocompleteAPIView -> UserAutocompleteAjaxView
- UserAutocompleteRedirectAPIView -> UserAutocompleteRedirectAjaxView

API View Class Changes

SODARAPIBaseView and APIPermissionMixin have been removed. Please use appropriate classes and mixins found in projectroles.views_ajax instead.

Base Test Class and Mixin Changes

Base test classes and helper mixins in projectroles have been changed as detailed below.

- SODARAPIViewMixin has been moved into projectroles.test_views_api and renamed into SODARAPIViewTestMixin.
- KnoxAuthMixin has been combined into SODARAPIViewTestMixin.
- get_accept_header() returns the header as dict instead of a string.
- assert_render200_ok() and assert_redirect() have been removed from TestPermissionBase. Please use assert_response() instead.

In addition to the aforementioned changes, certain minor setup details such as default user rights and may have changed. If you experience unexpected failures in your tests, please review the SODAR Core base test classes and helper methods, refactoring your tests where required.

User Group Updating

The set_user_group() helper has been moved from projectroles.utils into the SODARUser model. It is called automatically on SODARUser.save(), so manual calling of the method is not required for most cases.

System Prerequisites

The following third party JS/CSS requirements have been updated:

- JQuery v3.4.1
- Bootstrap v4.4.1
- Popper.js v1.16.0

The minimum supported versions have been upgraded for a number of Python packages in this release. It is highly recommended to also upgrade these for your SODAR Core based site. See the **requirements** directory for up-to date dependencies.

The minimum version requirement for Django has been bumped to 1.11.29.

Default Templates Modified

The default template base_site.html has been modified in this version. If you override it with your own altered version, please review the difference and update your templates as appropriate.

SODAR Taskflow v0.4.0 Required

If using SODAR Taskflow, this release requires release v0.4.0 or higher due to required support for the $role_update_irods_batch$ flow.

Known Issues

- Category roles beyond owner are not synchronized to target sites in remote project sync. This was omitted to maintain compatibility in existing APIs in this release. The feature is intended to be implemented in SODAR Core v0.9.
- Project/user app settings cannot be set or updated in the project REST API. A separate API for this will be developed. Currently the only way to modify app settings is via the GUI.

5.29.24 v0.7.2 (2020-01-31)

Release Highlights

- Enforce API versions in remote project sync
- Separate base API views for SODAR Core API and external SODAR site APIs
- Redesign user autocomplete field
- Set issuing user email to reply-to header for role and invite emails
- Display hidden project app settings to superusers in project update form
- Allow providing custom keyword arguments for backend plugin get_api() through get_backend_api()
- Enable sorting custom project list columns in plugin definition
- Bug fixes for project list columns

Breaking Changes

User Autocomplete Field Redesigned

User autocomplete field for forms with its related widget(s) have been redesigned with breaking API changes. Please review the *Project App Development* documentation and modify your implementation accordingly.

Remote Project Sync API Version Enforcing

The remote project sync view initiated from a TARGET site now sends the version number, making the SOURCE site enforce allowed API versions in its request. Hence, when a major breaking change is made on the source site and version requirements updated, requests from the target site will no longer work without upgrading to the latest SODAR Core version.

Exceptions Raised by get_backend_api()

The get_backend_api() method for retrieving backend plugin API objects no longer suppresses potential exceptions raised by API object initialization. If it is possible for your API object to raise an exception on initialization, you will need to handle it when calling this method.

System Prerequisites

The minimum version requirement for Django has been bumped to 1.11.27.

KnoxAuthMixin in Tests

Default API configuration for methods in KnoxAuthMixin are now set to internal SODAR Core API values. If you use the mixin in the tests of your site, please update the arguments in your method calls accordingly. You can also now supply the *media_type* argument for relevant functions. The get_accept_header() method has been moved to a separate SODARAPIViewMixin helper mixin.

5.29.25 v0.7.1 (2019-12-18)

Release Highlights

- Project list layout and extra column handling improved
- · Allow customizing widgets in app settings
- Enable managing global JS/CSS includes in Django settings
- Initial support for deploying site in kiosk mode
- Critical bug fixes for category and project owner management

Breaking Changes

Default Templates Modified

The default templates base_site.html and login.html have been modified in this version. If you override them with your own altered versions, please review the difference and update your templates as appropriate.

User Added to get_project_list_value()

The signature of the get_project_list_value() method implemented by project app plugins to return data for extra project list columns has changed. The user argument which provides the current user has been added. If using this feature, please make sure to update your implementation(s) of the method.

See Projectroles Django API Documentation to review the API changes.

5.29.26 v0.7.0 (2019-10-09)

Release Highlights

- Sync peer project information for remote target sites
- · Enable revoking access to remote projects
- Allow defining app settings in site apps
- "User in project" scope added into app settings
- Support JSON in app settings
- · Project owner management moved to project member views

Breaking Changes

System Prerequisites

The minimum supported versions have been upgraded for a number of Python packages in this release. It is highly recommended to also upgrade these for your SODAR Core based site. See the **requirements** directory for up-to date dependencies.

Backend Javascript Include

The code in **base.html** which was including javascript from backend apps to all templates in projectsroles was removed. Instead, Javascript and CSS associated to a backend plugin should now be included in app templates as needed. This is done using the newly introduced get_backend_include() template tag in projectroles_common_tags.

Deprecated get_setting() Tag Removed

The deprecated get_setting() template tag has been removed from projectroles_common_tags. Please use get_django_setting() in your templates instead.

ProjectSettingMixin Removed

In projectroles.tests.test_views, the deprecated ProjectSettingMixin was removed. If you need to populate app settings in your tests, use the AppSettingAPI instead.

AppSettingAPI get_setting_defs() Signature Changed

The get_settings_defs() function in the app settings API now accepts either a project app plugin or simply the name of the plugin as string. Due to this change, the signature of the API function including argument order has changed. Please see the *API documentation* for more details and update your function calls accordingly.

Default Footer Styling Changed

The styling of the page footer and the default _footer.html have changed. You no longer need an extra <div> element for the footer content, unless you need to do styling overrides yourself.

5.29.27 v0.6.2 (2019-06-21)

Release Highlights

- Allow hiding app settings from UI forms
- Add template tag for retrieving app settings

Breaking Changes

System Prerequisites

The minimum version requirement for Django has been bumped to 1.11.21.

Template Tag for Django Settings Access Renamed

The get_setting() template tag in projectroles_common_tags has been renamed into get_django_setting(). In this version the old tag still works, but this deprecation protection will be removed in the next release. Please update any references to this tag in your templates.

5.29.28 v0.6.1 (2019-06-05)

- Add custom project list columns definable in ProjectAppPlugin
- Add example project list column implementation in the filesfolders app

App Settings Deprecation Protection Removed

The deprecation protection set up in the previous release has been removed. Project app plugins are now expected to declare app_settings in the format introduced in v0.6.0.

5.29.29 v0.6.0 (2019-05-10)

Release Highlights

- Add user specific settings
- Refactor project settings into project/user specific app settings
- Add siteinfo app

Breaking Changes

App Settings (Formerly Project Settings)

The former Project Settings module has been completely overhauled in this version and requries changes to your app plugins.

The projectroles.project_settings module has been renamed into projectroles.app_settings. Please update your dependencies accordingly.

Settings must now be defined in app_settings. The format is identical to the previous project_settings dictionary, except that a scope field is expected for each settings. Currently valid values are "PROJECT" and "USER". It is recommended to use the related constants from SODAR_CONSTANTS instead of hard coded strings.

Example of settings:

```
#: Project and user settings
app_settings = {
    'project_bool_setting': {
        'scope': 'PROJECT',
        'type': 'BOOLEAN',
        'default': False,
        'description': 'Example project setting',
    },
    'user_str_setting': {
        'scope': 'USER',
        'type': 'STRING',
        'label': 'String example',
        'default': '',
        'description': 'Example user setting',
    },
}
```

Warning: Deprecation protection is place in this version for retrieving settings from project_settings if it has not been changed into app_settings in your project apps. This protection will be removed in the next SODAR Core release.

5.29.30 v0.5.1 (2019-04-16)

Release Highlights

- Sodarcache refactoring and improvements for API, models, management and app config
- New default error templates

Breaking Changes

Site App Templates

Templates for **site apps** should extend projectroles/base.html. In earlier versions the documentation erroneously stated projectroles/project_base.html as the base template to use. Extending that document does work in this version as long as you override the given template blocks. However, it is not recommended and may break in the future.

Sodarcache App Changes

The following potentially breaking changes have been made to the sodarcache app.

App configuration naming has been changed to sodarcache.apps.SodarcacheConfig. Please update config/ settings/base.py accordingly.

The field user has been made optional in models and the API.

An optional user argument has been added to ProjectAppPlugin.update_cache(). Correspondingly, the similar argument in ProjectCacheAPI.set_cache_item() has been made optional. Please update your plugin implementations and function calls accordingly.

The updatecache management command has been renamed to synccache.

Helper get_app_names() Fixed

The projectroles.utils.get_app_names() function will now return nested app names properly instead of omitting everything beyond the topmost module.

Default Admin Setting Deprecation Removed

The PROJECTROLES_ADMIN_OWNER setting no longer works. Use PROJECTROLES_DEFAULT_ADMIN instead.

5.29.31 v0.5.0 (2019-04-03)

- New sodarcache app for caching and aggregating data from external services
- Local user mode for site UI and remote sync
- Improved display and logging of remote project sync
- Upgrade to Bootstrap 4.3.1

Default Admin Setting Renamed

The setting PROJECTROLES_ADMIN_OWNER has been renamed into PROJECTROLES_DEFAULT_ADMIN to better reflect its uses. Please rename this settings variable on your site configuration to prevent issues.

Note: In this release, the old settings value is still accepted in remote project management to avoid sudden crashes. This deprecation will be removed in the next release.

Bootstrap 4.3.1 Upgrade

The Bootstrap and Popper dependencies have been updated to the latest versions. Please test your site to make sure this does not result in compatibility issues. The known issue of HTML content not showing in popovers has already been fixed in projectroles.js.

Default Templates Modified

The default templates base_site.html and login.html have been modified in this version. If you override them with your own altered versions, please review the difference and update your templates as appropriate.

5.29.32 v0.4.5 (2019-03-06)

Release Highlights

- Add user autocomplete in forms
- Allow multiple delegates per project

Breaking Changes

System Prerequisites

The minimum version requirement for Django has been bumped to 1.11.20.

User Autocomplete Widget Support

Due to the use of autocomplete widgets for users, the following apps must be added into THIRD_PARTY_APPS in config/settings/base.py, regardless of whether you intend to use them in your own apps:

```
THIRD_PARTY_APPS = [
    # ...
    'dal',
    'dal_select2',
]
```

Project.get_delegate() Helper Renamed

As the limit for delegates per project is now arbitrary, the Project.get_delegate() helper function has been replaced by Project.get_delegates(). The new function returns a QuerySet.

Bootstrap 4 Crispy Forms Overrides Removed

Deprecated site-wide Bootstrap 4 theme overrides for django-crispy-forms were removed from the example site and are no longer supported. These workarounds were located in {SITE_NAME}/templates/bootstrap4/. Unless specifically required forms on your site, it is recommended to remove the files from your project.

Note: If you choose to keep the files or similar workarounds in your site, you are responsible of maintaining them and ensuring SODAR compatibility. Such site-wide template overrides are outside of the scope for SODAR Core components. Leaving the existing files in without maintenance may cause undesireable effects in the future.

Database File Upload Widget

Within SODAR Core apps, the only known issue caused by removal of the aforementioned Bootstrap 4 form overrides in the file upload widget of the django-db-file-upload package. If you are using the file upload package in your own SODAR apps and have removed the site-wide Crispy overrides, you can fix this particular widget by adding the following snippet into your form template. Make sure to replace {FIELD_NAME} with the name of your form field.

```
{% block css %}
  {{ block.super }}
  {# Workaround for django-db-file-storage Bootstrap4 issue (#164) #}
  <style type="text/css">
    div#div_id_{FIELD_NAME} div p.invalid-feedback {
    display: block;
  }
  </style>
{% endblock css %}
```

Alternatively, you can create a common override in your project-wide CSS file.

5.29.33 v0.4.4 (2019-02-19)

Release Highlights

N/A (maintenance/bugfix release)

Textarea Height in Forms

Due to this feature breaking the layout of certain third party components, textarea height in forms is no longer adjusted automatically. An exception to this are Pagedown-specific markdown fields.

To adjust the height of a textarea field in your forms, the easiest way is to modify the widget of the related field in the __init__() function of your form as follows:

```
self.fields['field_name'].widget.attrs['rows'] = 4
```

5.29.34 v0.4.3 (2019-01-31)

Release Highlights

- Add display name configuration for projects and categories
- Hide immutable fields in projectroles forms

Breaking Changes

SODAR Constants

PROJECT_TYPE_CHOICES has been removed from SODAR_CONSTANTS, as it can vary depending on implemented **DISPLAY_NAMES**. If needed, the currently applicable form structure can be imported from projectroles.forms.

5.29.35 v0.4.2 (2019-01-25)

Release Highlights

N/A (maintenance/bugfix release)

Breaking Changes

System Prerequisites

The following minimum version requirements have been upgraded in this release:

- Django 1.11.18+
- Bootstrap 4.2.1
- JQuery 3.3.1
- Numerous required Python packages (see requirements/*.txt)

Please go through your site requirements and update dependencies accordingly. For project stability, it is still recommended to use exact version numbers for Python requirements in your SODAR Core based site.

If you are overriding the projectroles/base_site.html in your site, make sure to update Javascript and CSS includes accordingly.

Note: Even though the recommended Python version from Django 1.11.17+ is 3.7, we only support Python 3.6 for this release. The reason is that some dependencies still exhibit problems with the most recent Python release at the time of writing.

ProjectAccessMixin

The _get_project() function in ProjectAccessMixin has been renamed into get_project(). Arguments for the function are now optional and may be removed in a subsequent release: self.request and self.kwargs of the view class will be used if the arguments are not present.

Base API View

The base SODAR API view has been renamed from BaseAPIView into SODARAPIBaseView.

Taskflow Backend API

The cleanup() function in TaskflowAPI now correctly raises a CleanupException if SODAR Taskflow encounters an error upon calling its cleanup operation. This change should not affect normally running your site, as the function in question should only be called during Taskflow testing.

5.29.36 v0.4.1 (2019-01-11)

Release Highlights

- Configuration updates for API and Projectroles
- Travis-CI setup

Breaking Changes

System Prerequisites

Changes in system requirements:

- Ubuntu 16.04 Xenial is the target OS version.
- Python 3.6 or newer required: 3.5 and older releases no longer supported.
- **PostgreSQL 9.6** is the recommended minimum version for the database.

Site Messages in Login Template

If your site overrides the default login template in projectroles/login.html, make sure your overridden version contains an include for projectroles/_messages.html. Following the SODAR Core template conventions, it should be placed as the first element under the container-fluid div in the content block. Otherwise, site app messages not requiring user authorization will not be visible on the login page. Example:

```
{% block content %}
  <div class="container-fluid">
    {# Django messages / site app messages #}
    {% include 'projectroles/_messages.html' %}
    {# ... #}
    </div>
{% endblock content %}
```

5.29.37 v0.4.0 (2018-12-19)

Release Highlights

- Add filesfolders app from SODAR v0.4.0
- Add bgjobs app from Varfish-Web
- Secure SODAR Taskflow API views
- Separate test server configuration for SODAR Taskflow
- Extra data variable rendering for timeline
- Additional site settings

Breaking Changes

List Button Classes in Templates

Custom small button and dropdown classes for including buttons within tables and lists have been modified. The naming has also been unified. The following classes should now be used:

- Button group: sodar-list-btn-group (formerly sodar-edit-button-group)
- Button: sodar-list-btn
- Dropdown: sodar-list-dropdown (formerly sodar-edit-dropdown)

See projectroles templates for examples.

Warning: The standard bootstrap class btn-sm should not be used with these custom classes!

SODAR Taskflow v0.3.1 Required

If using SODAR Taskflow, this release requires release v0.3.1 or higher due to mandatory support of the TASKFLOW_SODAR_SECRET setting.

Taskflow Secret String

If you are using the taskflow backend app, you **must** set the value of TASKFLOW_SODAR_SECRET in your Django settings. Note that this must match the similarly named setting in your SODAR Taskflow instance!

5.29.38 v0.3.0 (2018-10-26)

Release Highlights

- Add remote project metadata and member synchronization between multiple SODAR sites
- Add adminalerts app
- Add taskflowbackend app

Breaking Changes

Remote Site Setup

For specifying the role of your site in remote project metadata synchronization, you will need to add two new settings to your Django site configuration:

The PROJECTROLES_SITE_MODE setting sets the role of your site in remote project sync and it is **mandatory**. Accepted values are SOURCE and TARGET. For deployment, it is recommended to fetch this setting from environment variables.

If your site is set in TARGET mode, the boolean setting PROJECTROLES_TARGET_CREATE must also be included to control whether creation of local projects is allowed. If your site is in SOURCE mode, this setting can be included but will have no effect.

Furthermore, if your site is in TARGET mode you must include the PROJECTROLES_ADMIN_OWNER setting, which must point to an existing local superuser account on your site.

Example for a SOURCE site:

```
# Projectroles app settings
PROJECTROLES_SITE_MODE = env.str('PROJECTROLES_SITE_MODE', 'SOURCE')
```

Example for a TARGET site:

```
# Projectroles app settings
```

```
PROJECTROLES_SITE_MODE = env.str('PROJECTROLES_SITE_MODE', 'TARGET')
PROJECTROLES_TARGET_CREATE = env.bool('PROJECTROLES_TARGET_CREATE', True)
PROJECTROLES_ADMIN_OWNER = env.str('PROJECTROLES_ADMIN_OWNER', 'admin')
```

General API Settings

Add the following lines to your configuration to enable the general API settings:

```
SODAR_API_DEFAULT_VERSION = '0.1'
SODAR_API_MEDIA_TYPE = 'application/vnd.bihealth.sodar+json'
```

DataTables Includes

Includes for the DataTables Javascript library are no longer included in templates by default. If you want to use DataTables, include the required CSS and Javascript in relevant templates. See the projectroles/search.html template for an example.

5.30 SODAR Core Changelog

Changelog for the SODAR Core Django app package. Loosely follows the Keep a Changelog guidelines.

5.30.1 v0.11.1 (2023-01-09)

Added

- Projectroles
 - Allow enabling project breadcrumb scrolling (#1037)
 - PROJECTROLES_BREADCRUMB_STICKY Django setting (#1037)
 - ProjectAccessMixin external app model support (#1067)
 - Project.get_log_title() helper (#1071)

Changed

- General
 - Upgrade minimum Django version to v3.2.16 (#1035)
 - Upgrade Python dependencies (#1073)
- Timeline
 - Extra data loading using Ajax view (#1055)

- General
 - Use apt-get instead of apt in CI (#1030)
 - Incorrect branch in README.rst Coveralls link (#1031)
 - Postgres role errors in GitHub Actions CI (#1033)
 - install_postgres.sh breaking with unsupported Ubuntu versions (#1061)
- Timeline
 - Extra data not displayed after viewing event details (#1055)
 - Crash in get_app_icon_html() with project event from site app (#1057)
 - Crash from missing plugin_lookup in timeline_site.html (#1076)

Removed

- General
 - Unused about.html template (#1029)

5.30.2 v0.11.0 (2022-09-23)

Added

- General
 - Coverage reporting with Coveralls (#1026)
- Projectroles
 - Project modifying API in ProjectModifyPluginMixin (#387)
 - PROJECTROLES_ENABLE_MODIFY_API Django setting (#387)
 - PROJECTROLES_MODIFY_API_APPS Django setting (#387)
 - syncmodifyapi management command (#387)
 - SODARBaseAjaxMixin with SODARBaseAjaxView functionality (#994)
 - Custom login view content via include/_login_extend.html (#982)

- General
 - Upgrade minimum PostgreSQL version to v11 (#303)
 - Upgrade minimum Django version to v3.2.15 (#1003)
 - Upgrade to black v22.6.0 (#1003)
 - Upgrade general Python dependencies (#1003, #1019)
- Filesfolders
 - Change public_url form label (#1016)

- Projectroles
 - Replace Taskflow specific code with project modifying API calls (#387)
 - Rename revoke_failed_invite() to revoke_invite()
 - Do not return submit_status from project API views (#971)
 - Remove required owner argument for ProjectUpdateAPIView (#1007)
 - Remove unused owner operations from ProjectModifyMixin (#1008)
 - Refactor and cleanup AppSettingAPI (#1024)
- Timeline
 - Deprecate ProjectEvent.get_current_status(), use get_status() (#322)

- Projectroles
 - Crash at exception handling in clean_new_owner() (#981)
 - Incorrect button icon in remote site form (#1001)
 - Case-sensitive project list sorting (#1006)
 - Project list filtering not trimmed (#1021)
- Timeline
 - Uncaught exceptions in get_plugin_lookup() (#979)

Removed

- General
 - Codacy support (#1022)
- Projectroles
 - Taskflow specific views, tests and API calls (#387)
 - get_taskflow_sync_data() method from ProjectAppPluginPoint (#387)
 - Project.submit_status field and usages in code (#971)
- Taskflowbackend
 - Remove app and implement in SODAR (#387)
- Timeline
 - Taskflow API views (#387)

5.30.3 v0.10.13 (2022-07-15)

Added

- General
 - GitHub issue templates (#995)
- Projectoles
 - Taskflow access from a different host for tests (#986)
 - TASKFLOW_TEST_SODAR_HOST to set host name for tests (#986)

Changed

- General
 - Update development and contributing documentation (#988, #989, #992, #996)
 - Update Actions and Codacy badges for new GitHub repository (#990, #991)
 - Upgrade minimum Django version to v3.2.14 (#993)

Fixed

- Projectroles
 - Project list role column fails if only categories are visible (#985)

5.30.4 v0.10.12 (2022-04-19)

Added

- Timeline
 - Support for specifying plugin for events (#975)

- General
 - Upgrade to black v22.3.0 (#972)
 - Upgrade minimum Django version to v3.2.13 (#976)
- Projectroles
 - Update sidebar icon padding on resize (#967)
 - Batch loading for project list columns (#968)
 - Optimize ProjectListRoleAjaxView
 - Refactor sidebar toggling (#970)
 - Make request optional for send_generic_mail() and send_mail()

5.30.5 v0.10.11 (2022-03-22)

Added

- Projectroles
 - Sidebar icon scaling using PROJECTROLES_SIDEBAR_ICON_SIZE (#843)

Changed

- General
 - Upgrade to setuptools v59.6.0 (#948)
 - Unify Django messages in UI (#961)
- Projectroles
 - Refactor ProjectSearchResultsView and search_results.html (#955, #958)
 - Force user to select type in project create form (#963)
 - Optimize parent queries in project update form (#965)

Fixed

- General
 - Incorrect version for ipdb dependency (#951)
- Filesfolders
 - Template crashes from missing FileData (#962)
- Projectroles
 - App search results template included if no results found (#958)
 - Inconsistent sidebar icon size (#960)
 - get_display_name() use in Django messages and forms (#952)
 - Projects not displayed in project list for inherited owner (#966)

Removed

- Projectroles
 - get_not_found_alert() template tag (#955)

5.30.6 v0.10.10 (2022-03-03)

Added

- Tokens
 - Success messages for token creation and deletion (#935)
- Userprofile
 - Success message for user settings update (#936)

Changed

- Projectroles
 - Improve project list loading layout (#937)
 - Make project list responsive when under category (#938)
 - Enable testing knox auth for REST API views without a token

Fixed

- Projectroles
 - Duplicate terms not removed in advanced search (#943)
 - ProjectSearchResultsView.get_context_data() called twice (#944)
 - Redundant backend API initialization in check_backend() (#946)

5.30.7 v0.10.9 (2022-02-16)

Added

- Projectroles
 - req_kwargs arg for TestPermissionMixin.assert_response() (#909)
 - Starring and filtering controls for category subproject list (#56)
 - Enable anonymous access for Ajax views with allow_anonymous (#916)

- General
 - Use LATEST_RELEASE in Chromedriver install (#906)
- Projectroles
 - Project list client side loading (#825, #908, #913, #933)
 - Optimize project list queries (#922, #923)
 - Move project starring JQuery into project_star.js (#930)
- Timeline

- Display event details as a modal (#910, #912)
- Make description optional for _make_event_status() (#890)

- Projectroles
 - Project list JQuery loaded in project detail view (#914)
 - sodar-modal-wait layout (#931)
 - Redundant project starring JQuery includes (#930)
- Timeline
 - Event status layout overflowing (#911)

Removed

- Projectroles
 - Unused project list templates and template tags (#913)
- Timeline
 - Unused get_event_details() template tag

5.30.8 v0.10.8 (2022-02-02)

Added

- Projectroles
 - Disabling ManagementCommandLogger with LOGGING_DISABLE_CMD_OUTPUT (#894)
- Siteinfo
 - Missing site settings in CORE_SETTINGS (#877)
- Timeline
 - get_plugin_lookup() and get_app_icon_html() template tags (#888)
 - Template tag tests (#891)

- General
 - Upgrade minimum Python version to v3.8, add v3.10 support (#885)
 - Upgrade minimum Django version to v3.2.12 (#879, #902)
 - Upgrade Python dependencies (#884, #893, #901)
 - Upgrade to Chromedriver v97 (#905)
- Projectroles
 - Display admin icon in user dropdown (#886)

- Refactor UI tests (#882)
- Timeline
 - Improve event list layout responsivity (#887)
 - Replace event list app column with app icon (#888)
 - Set default kwarg values for model test helpers (#890)
 - Move get_request() to TimelineAPIMixin
 - Display recent events regardless of status in details card (#899)
 - Optimize get_details_events() (#899)

- Projectroles
 - Parent owner set as owner in project create form for non-owner category members (#878)
 - Project header icon tooltip alignment (#895)
 - Redundant public access icon display for categories (#896)
 - Icon size syntax (#875)
 - Content of sodar-code-input partially hidden in Chrome (#904)
- Siteinfo
 - Layout responsivity issues with long labels (#883)
- Timeline
 - Redundant app plugin queries in event list (#889, #900)

Removed

- Projectroles
 - _add_remote_association() helper from UI tests (#882)
- Timeline
 - Unused get_app_url() template tag (#888)

5.30.9 v0.10.7 (2021-12-14)

Added

- Adminalerts
 - UI documentation (#865)
- Siteinfo
 - UI documentation (#865)

Changed

- General
 - Upgrade minimum Django version to v3.2.10 (#869)
 - Upgrade to python-ldap v3.4.0 (#871)
- Projectroles
 - HTTP 403 raised instead of 400 if project type disallowed by API view (#872)
 - Update role list media rules (#863)
 - Add line break for custom email footer (#864)

Fixed

- Projectroles
 - ManagementCommandLogger crash by unset LOGGING_LEVEL (#862)
 - highlight_search_term() crash on invalid term input (#867)
 - Search bar allowing invalid input (#868)
 - Wrong project type displayed in project type restriction API response (#872)

5.30.10 v0.10.6 (2021-11-19)

Added

- General
 - LOGGING_LEVEL setting in example configs (#822)
 - ProfilingMiddleware for cProfile profiling in debug more (#839)
 - PROJECTROLES_ENABLE_PROFILING setting for profiling (#839)
- Projectroles
 - cleanup_method arg for assert_response() (#823)
 - Timeline object and data helpers in site and backend plugins (#832)
 - ManagementCommandLogger helper (#844)
 - get_email_user() helper(#845)
 - Project type restriction in API views with project_type attribute (#850)
 - Project.has_public_children field (#851)
 - Email sending for additional user emails (#861)
 - user_email_additional app setting (#861)
 - email.get_user_addr() helper(#861)

Changed

- General
 - Upgrade to Chromedriver v96 (#818, #847, #852)
 - Use LOGGING_LEVEL in example set_logging() (#822)
 - Upgrade minimum Django version to v3.2.9 (#835, #848)
 - Improve management command output and logging (#844)
 - Optimize project list queries (#851)
- Filesfolders
 - Refactor checkAll() helper (#816)
 - Restrict project type in API views (#850)
- Projectroles
 - Upgrade DataTables includes on search results page (#841, #856)
 - Improve email subject prefix formatting (#829)
 - Update user representations in emails (#845)
- Timeline
 - Refactor TimelineAPI

- General
 - Github Actions CI failure by old package version (#821)
 - Codacy code quality badge in README (#815)
- Appalerts
 - Random crashes in TestTitlebarBadge.test_alert_dismiss_all (#811)
- Projectroles
 - sodar-overflow-container failing with certain tables (#830)
 - Sort icons not displayed on search results page (#841)
 - App alert badge content wrapping (#846)
 - Nested categories with public children not displayed correctly for anon users (#853, #855)
 - Public and remote icons breaking project title bar layout (#859)
- Timeline
 - Crash from invalid plugin name in get_event_description() (#831)
 - Redundant database queries in get_event_description() (#834)
 - Site and backend plugins not supported in get_event_description() (#832)

Removed

- Projectroles
 - get_star() template tag (#851)
 - Project.has_public_children() method: use has_public_children instead (#851)

5.30.11 v0.10.5 (2021-09-20)

Added

- Appalerts
 - Display project badge in alert (#790, #801)
 - Dismiss all link in title bar badge (#802)
- Projectroles
 - exact kwarg for assert_element_count() in UI tests (#798)
 - Custom email header and footer (#789)
 - PROJECTROLES_EMAIL_HEADER and PROJECTROLES_EMAIL_FOOTER settings (#789)
 - get_all_defs() helper in AppSettingAPI (#808)

- General
 - Unify app settings label notation (#793)
 - Upgrade minimum Django version to v3.2.7 (#800)
- Appalerts
 - Improve alert list layout (#790)
- Projectroles
 - Improve login button locating in login_and_redirect_with_ui() (#796)
 - Hide skipped app settings from target remote sync view (#785)
 - Improve app settings layout in target remote sync view (#804)
 - Minor remote sync refactoring (#721, #785, #807)
 - Refactor _get_projectroles_settings() into get_projectroles_defs() (#803)

- Appalerts
 - Redundant HTML anchor in Dismiss All button (#788)
- Projectroles
 - Sidebar notch position (#787)
 - sodar-overflow-container misalignment (#791)
 - App settings recreated if value is identical (#785)
 - Line separators in remoteproject_sync.html (#805)
 - App settings remote sync only supporting projectroles (#806, #809)
 - Plugin name incorrectly displayed in target remote sync view (#810)
 - Active link check for projectroles URLs ignoring app name (#814)

Removed

- Projectroles
 - get_plugin_name_by_id() template tag (#812)

5.30.12 v0.10.4 (2021-08-19)

Added

- General
 - LOGGING_APPS and LOGGING_FILE_PATH settings in example site (#762)
 - Siteinfo app to logged apps in base config (#767)
- Appalerts
 - "Dismiss All" button in alert list (#770, #781)
 - Update list view with reload link on added alerts (#780)
- Siteinfo
 - ENABLED_BACKEND_PLUGINS in CORE_SETTINGS (#766)

- General
 - Upgrade to Chromedriver v92 (#772)
 - Upgrade minimum Django version to v3.2.6 (#773)
- Appalerts
 - Display no alerts element after clearing list (#779)
- Projectroles
 - Refactor view test setup (#769)

• Siteinfo

- UI improvements for empty and unset values

Fixed

- General
 - SAML attribute map example in config (#760)
 - Docs layout broken by docutils>=0.17 (#763)
 - Logging level not correctly set for all loggers (#771)
- Projectroles
 - HTTP 403 raised instead of 404 in API and UI views if object not found (#774)
 - Incorrect message on ownership transfer email notifications (#778)
 - Project update view loading slowed down by large number of child categories (#765)
- Siteinfo
 - Plugin settings not read if get_statistics() raises exception (#767)
 - List layout broken by empty string values (#768)

5.30.13 v0.10.3 (2021-07-01)

Changed

- General
 - Upgrade minimum Django version to v3.2.5 (#744)
 - Upgrade Python dependencies (#744)
- Userprofile
 - Hide user update button for non-local users (#748)

- Projectroles
 - False errors from app settings sync if app not installed on target site (#757)
- Timeline
 - Uncaught exceptions in get_event_description() (#749)
- Tokens
 - Expiry date incorrectly displayed in token list (#747)
 - Missing query set ordering in token list (#754)

Removed

- Tokens
 - Unused admin and models modules

5.30.14 v0.10.2 (2021-06-03)

Changed

- General
 - Upgrade to Chromedriver v90 (#731)
 - Rename example site adminalerts URL include (#730)
 - Update documentation screenshots (#734)
 - Reorganize static files in documentation (#734)
 - Rename example django-db-file-storage URL pattern (#732)
 - Upgrade minimum Django version to v3.2.4 (#727)
 - Upgrade Python dependencies (#727)
 - Reformat with Black v21.5b2
- Projectroles
 - Display anonymous icon in titlebar dropdown if not logged in (#726)

- General
 - Figure aspect ratios in documentation (#735)
- Projectroles
 - Unhandled exceptions and missing data in project list extra columns (#733)
 - Project star icon alignment (#736)
 - Project list layout broken by FILESFOLDERS_SHOW_LIST_COLUMNS setting (#737)
 - Public guest access role not displayed in project list (#739)
- Timeline
 - Crash in add_event() if called with AnonymousUser (#740)

5.30.15 v0.10.1 (2021-05-06)

Added

- General
 - Installation via PyPI (#293)
- Appalerts
 - Update alerts in JQuery without page reloading (#701, #723)
 - APPALERTS_STATUS_INTERVAL setting (#701)

Changed

- General
 - Upgrade minimum Django version to v3.2.1 (#696)
 - Upgrade django-debug-toolbar to v3.2.1 (#706)
- Appalerts
 - Tweak alert layout (#716)
- Projectroles
 - Enforce 3 character minimum limit for terms in multi-term search (#715)
 - Improve remote sync stability

- General
 - Add build/ to .gitignore (#707)
 - Invalid operating system qualifier in setup.py (#708)
- Projectroles
 - Uncaught exceptions in app plugin search() (#713)
 - Broken project icon on search results page (#714)
 - Empty search terms not sanitized (#715)
 - Hardcoded optional PROJECTROLES_DISABLE_CATEGORIES setting in forms (#719)
 - Remote sync objects referred by database ID instead of sodar_uuid (#720)
 - Uncaught exceptions in app settings remote sync (#720)
 - Assumed sodar_uuid match for target app settings in remote sync (#722)

5.30.16 v0.10.0 (2021-04-28)

Added

- Adminalerts
 - get_statistics() implementation
- Appalerts
 - Add site app and backend for app alerts (#642)
- Projectroles
 - geticons management command for retrieving Iconify icons (#54)
 - spin class in projectroles.css for spinning icon support (#54)
 - Optional public guest access for projects (#574)
 - public_guest_access and set_public() in Project model (#574)
 - Enable allowing anonymous access to site (#574)
 - PROJECTROLES_ALLOW_ANONYMOUS site setting (#574)
 - is_allowed_anonymous predicate in rules (#574)
 - site_app_processor in context_processors (#574)
 - get_statistics() in SiteAppPluginPoint
 - info_settings in app plugins (#671)
 - plugin_type argument in get_app_plugin() (#309)
 - handle_project_update() in ProjectAppPlugin (#387, #675)
 - App alerts for project and role updates (#642, #692)
- Siteinfo
 - Display selected Django settings in UI (#671)
- Timeline
 - Permission tests (#144)
 - Site app plugin for site-wide events (#668)
- Tokens
 - Permission tests

- General
 - Upgrade project to Django v3.2 (#194, #695)
 - Upgrade Python dependencies (#194, #678, #685)
 - Rename GitHub repo to sodar-core (#699)
 - Rename master branch to main
 - Use Iconify for icons (#54)

- Use Material Design Icons as default icon set (#54)
- Bump minimum Python version requirement to v3.7 (#121)
- Upgraded versioneer (#656)
- Update views, mixins and tags for anonymous user access (#574)
- Upgrade recommended development OS version to Ubuntu v20.04 (#640)
- Do not send redundant emails to users initiating updates (#693)
- Get all app settings from environment
- Projectroles
 - Set parent owner as initial owner in project form (#667)
 - Always show Django admin warning (#677)
 - Modify signature of get_history_dropdown() template tag (#668)
 - Add default superuser value to LiveUserMixin._make_user()
 - Include select2 CSS locally (#457)
 - Refactor cleanappsettings (#673)
- Siteinfo
 - Tabbed layout in site info view
- Timeline
 - Make project and user fields in ProjectEvent optional (#119, #668)
 - Modify signatures of get_object_url() and get_object_link() helpers (#668)
 - Allow custom INIT status data (#700)
- Tokens
 - Refactor view tests

- General
 - All app settings not properly frozen in test config (#688)
- Adminalerts
 - Pagedown widget breaking CSS layout in Firefox (#659)
- Bgjobs
 - Plugin queries in template tag module root (#653)
- Projectroles
 - Description line spacing in project header (#632)
 - Pagedown widget breaking CSS layout in Firefox (#659)
 - Crash by missing optional PROJECTROLES_DELEGATE_LIMIT setting (#676)
 - cleanappsettings deleting defined app settings (#673)
- Timeline

- Double status added when calling add_event() with INIT type (#700)

Removed

- General
 - Font Awesome support without Iconify (#54)
- Projectroles
 - get_site_app() template tag (#574)
 - Deprecated search functionality with a single search_term (#618)
 - Deprecated get_full_title() method from Project model (#620)

5.30.17 v0.9.1 (2021-03-05)

Added

- Projectroles
 - Inline head include from environment variables in base template (#639)
 - req_kwargs argument in SODARAPIPermissionTestMixin.assert_response_api() (#662)
 - Display inherited owner note in remote project sync UI (#643)
 - is_inherited_owner() template tag

Changed

- General
 - Improve Codacy support in GitHub Actions
 - Upgrade to Chromedriver v89 (#657)
- Projectroles
 - Duplicate sodar_uuid in SODARNestedListSerializer (#633)
 - Rename and refactor LocalUserForm and user_form.html (#651)

- Filesfolders
 - File list breadcrumb icon alignment (#660)
 - Cancel link in batch edit view (#647)
 - Batch move folders not displayed in UI (#648)
 - Batch moving objects to project root failing (#661)
- Projectroles
 - Login redirect URLs with query strings not properly handled by assert_response() (#635)
 - Remote project icons in project list not displayed (#664)

- Version 0.8.4 missing from CORE_API_ALLOWED_VERSIONS
- Userprofile
 - User update link and template not working as expected (#650)

Removed

- Userprofile
 - Unused template user_update.html (#651)

5.30.18 v0.9.0 (2021-02-03)

Added

- General
 - SAML SSO authentication support (#588)
 - REST API example HelloExampleProjectAPIView in example_project_app (#518)
- Projectroles
 - Projectroles app settings (#532)
 - Remote sync for projectroles app setting (#533, #586)
 - IP address based access restriction for projects (#531)
 - is_delegate() and is_owner_or_delegate() helpers for Project model
 - Remote sync for non-owner category members (#502)
 - setting_delete() function to AppSettingAPI (#538)
 - cleanappsettings management command (#374)
 - exclude_inherited argument in Project.get_delegates() (#595)
 - Value options for app settings of type STRING and INTEGER (#592)
 - Display placeholders for app setting form fields (#584)
 - Support for local user invites (#548, #613, #615, #621)
 - Local user account creation and updating (#547)
 - batchupdateroles management command (#15, #602)
 - Project invite REST API views (#15, #598)
 - Advanced search with multiple terms (#609)
 - Search result pagination control (#610)
 - REST API endpoint for retrieving current user info (#626)

Changed

- General
 - Replace development helper scripts with Makefile (#135)
 - Upgrade to Bootstrap v4.5.3 and jQuery v3.5.1 (#563)
 - Upgrade to Chromedriver v87
 - Upgrade general Python requirements (#576)
 - Migrate GitHub CI from Travis to GitHub actions (#577)
 - Refactor example PROJECT_USER scope app settings (#599)
 - Set logging level in test configurations to CRITICAL (#604)
- Filesfolders
 - Update search() and find() for multiple search terms (#609)
- Projectroles
 - Allow updating local app settings on a TARGET site (#545)
 - Refactor project list filtering (#566)
 - Move project list javascript to project_list.js (#566)
 - Rename owner role transfer URL pattern and timeline event (#590)
 - Add sodar_url override to modify_assignment()
 - Rename ProjectSearchResultsView and its template (#609)
 - Implement get_full_title() as Project.full_title field (#93)
 - Clarify invite accepting procedure in invite email (#627)
 - Redirect to home view when reusing accepted invite link (#628)
- Userprofile
 - Cosmetic updates for user detail template (#600)

- Projectroles
 - Invite redirect not working in Add Member view (#589)
 - Wrong role label displayed for category owner/delegate in member list (#593)
 - Django settings access in forms and serializers
 - Delegate limit check broken by existing delegate roles of inherited owners (#595)
 - Crash in project invite if multiple users exist with the same email (#614)
 - Project delegate able to revoke invite for another delegate (#617)
 - Column alignment in invite list (#606)
 - get_not_found_alert() fails if called with app plugin search type (#624)
- Taskflowbackend
 - Django settings access in api (#605)

- sodar_url override not working if request object is present (#605)

Removed

- General
 - Travis CI setup in .travis.yml (#577)
- Projectroles
 - Template _project_filter_item.html (#566)
 - Template tag get_project_list() (#566)
 - Deprecate old implementation of ProjectAppPluginPoint.search() (#609, #618)
 - Deprecate Project.get_full_title() (#93)

5.30.19 v0.8.4 (2020-11-12)

Changed

- General
 - Documentation updates for JOSS submission

5.30.20 v0.8.3 (2020-09-28)

Added

- General
 - Missing migration for the SODARUser model (#581)

- General
 - Upgrade to Chromedriver v85 (#569)
- Projectroles
 - Improve project list header legend (#571)
 - Make sync_source_data() atomic
 - Prevent creation of local projects under remote categories (#583)
- Siteinfo
 - Refactor app plugin statistics retrieval (#573)

- General
 - Invalid statement in setup_database.sh (#580)
- Projectroles
 - Missing exception handling for sync_source_data() calls (#582)
 - Crash from conflicting local category structure (#582)
- Siteinfo
 - Crash from exceptions raised by app plugin get_statistics() (#572)
- Timeline
 - CSS for sodar-tl-link-detail links (#578)

Removed

- General
 - Unused Pillow dependency (#575)

5.30.21 v0.8.2 (2020-07-22)

Added

- Bgjobs
 - Enable site-wide background jobs (#544)
 - Site app plugin for site-wide background jobs (#544)
- Projectroles
 - sodar-header-button CSS class (#550)
 - Logging for AppSettingAPI (#559)

- Projectroles
 - Upgrade to Chromedriver v83 (#543)
 - Rename is_app_link_visible() template tag into is_app_visible() (#546)
 - Refactor project list to reduce queries and template tag use (#551, #567)

- Projectroles
 - Transferring project ownership to inherited owner not allowed (#534)
 - Uniqueness constraint in AppSetting incompatible with PROJECT_USER scope settings (#542)
 - Inherited owner email address not displayed in project member list (#541)
 - App visibility check broken in project_detail.html (#546)
 - Invite accept for a category invoking Taskflow and causing a crash (#552)
 - Project form parent forced to wrong value if user lacks role in parent category (#558)
 - Invalid app_name not handled in AppSettingAPI.get_default_setting() (#560)
 - Empty JSON and false boolean app settings not set in project form (#557)
 - Minor Javascript errors thrown by projectroles.js (#536)
 - Long lines breaking email preview layout (#564)

5.30.22 v0.8.1 (2020-04-24)

Added

- Projectroles
 - CSS class sodar-pr-project-list-custom for custom project list items (#525)

Fixed

- Projectroles
 - CSS padding issue with sodar-list-btn and Chrome (#529, sodar#844)
 - Crash from missing optional setting PROJECTROLES_DISABLE_CATEGORIES (#524)
 - Remote project editing not prevented in REST API views (#523)

Removed

- Projectroles
 - Deprecated SODARAPIObjectInProjectPermissions base class (#527)

5.30.23 v0.8.0 (2020-04-08)

Added

- General
 - "For the Impatient" section in docs
- Filesfolders
 - API views for file, folder and hyperlink management (#443)

• Projectroles

- Import new REST API view base classes from SODAR (#48, #461)
- Import base serializers from SODAR (#462)
- API views for project and role management (#48, #450)
- projectroles.tests.test_views_api.TestAPIViewsBase for API view testing (#48)
- SODARAPIPermissionTestMixin for API view permission tests
- New helper methods in SODARAPIViewTestMixin
- Provide live server URL for Taskflow in TestTaskflowBase.request_data (#479)
- TestTaskflowAPIBase for testing API views with SODAR Taskflow (#488)
- Permission tests using Knox tokens (#476)
- Base Ajax view classes in projectroles.views_ajax (#465)
- Allow assigning roles for categories (#463)
- Allow displaying project apps in categories with category_enable (#447)
- Allow category delegates and owners to create sub-categories and projects (#464)
- get_role_display_name() helper in projectroles_common_tags (#505)
- get_owners(), is_owner() and get_all_roles() helpers for Project (#464)
- Allow using legacy UI test login method with PROJECTROLES_TEST_UI_LEGACY_LOGIN (#509)
- Allow moving categories and projects under different categories (#512)
- SODARForm and SODARModelForm base classes for forms
- Enable retrieving flat recursive list of children objects in Project.get_children()
- Support for data in permission test assert_response() method (#155)
- Taskflowbackend
 - get_inherited_roles() helper(#464)
- Timeline
 - get_models() helper
- Tokens
 - Add app from varfish-web (#452)

- General
 - Upgrade minimum Django version to v1.11.29 (#520)
 - Upgrade JQuery to v3.4.1 (#519)
 - Upgrade Bootstrap to v4.4.1 (#460)
 - General upgrade for Python package requirements (#124, #459)
 - Reorganize view classes and URL patterns (#480)
 - Refactor Ajax views (#465, #475)

- Update CONTRIBUTING.rst
- Use SODARForm and SODARModelForm base classes in forms
- Projectroles
 - Suppress peer site removal logging if nothing was removed (#478)
 - Refactor SODARCoreAPIBaseView into SODARCoreAPIBaseMixin (#461)
 - Allow providing single user to assert_response() in permission tests (#474)
 - Move SODARAPIViewTestMixin into test_views_api and rename (#471)
 - Move KnoxAuthMixin functionality into SODARAPIViewTestMixin
 - get_accept_header() in API tests returns header as dict
 - Refactor base permission test classes (#490)
 - Move utils.set_user_group() to SODARUser.set_group() (#483)
 - Call set_group() in SODARUser.save() (#483)
 - Replace projectroles_tags.is_app_hidden() with is_app_link_visible()
 - Inherit owner permissions from parent categories (#464)
 - Refactor project roles template (#505)
 - Disable owner updating in project update form (#508)
 - Allow updating project parent via SODAR Taskflow (#512)

Taskflowbackend

- Refactor synctaskflow management command and add logging
- Timeline
 - Display app for categories (#447)

- General
 - Duplicate contributing.rst redirection file in docs (#481)
 - .tox not ignored in black.sh
 - Coverage checks in Travis-CI (#507)
- Projectroles
 - Swapping owner and delegate roles not allowed if at delegate limit (#477)
 - Remote sync for owner role failing with specific user order in data (#439)
 - Redundant updating of Project.submit_status during project creation
 - Make test_widget_user_options() more reliable (#253)
 - Missing permission check by role type in RoleAssignmentDeleteView.post() (#492)
 - Unordered queryset warnings from the User model (#494)
 - Incorrect user iteration in test_user_autocomplete_ajax() (#469)
 - Redundant input validation preventing search with valid characters (#472)

- Local users disabled in local development configuration (#500)
- Member link not visible in responsive project dropdown (#466)
- CSS issues with Bootstrap 4.4.1 in search pagination (#372, #460)
- Raise ImproperlyConfigured for missing parameters in ProjectAccessMixin (#516)

• Timeline

- CSS issues with Bootstrap 4.4.1 (#460)

Removed

- Projectroles
 - SODARAPIBaseView base class, replaced by API view mixins (#461)
 - KnoxAuthMixin from view tests
 - get_selectable_users() from forms
 - Redundant render/redirect helpers from TestPermissionBase: use assert_response() instead (#484)
 - APIPermissionMixin for API views: use base API/Ajax view classes instead (#467)
 - is_app_hidden() from projectroles_tags

5.30.24 v0.7.2 (2020-01-31)

Added

• Projectroles

- custom_order argument in get_active_plugins() (#431)
- Enable ordering custom project list columns in project app plugin (#427)
- SODARCoreAPIBaseView base API view class for internal SODAR Core apps (#442)
- API version enforcing in RemoteProjectsSyncView and syncremote.py (#444)
- Allow extra keyword arguments in get_backend_api() (#397)
- Example usage of get_backend_api() extra kwargs in example_backend_app (#397)
- SODARUserChoiceField and get_user_widget() for user selection in forms (#455)
- Setting reply-to headers for role change and invite emails (#446)
- No reply note and related PROJECTROLES_EMAIL_SENDER_REPLY setting (#446)
- Display hidden project app settings to superusers (#424)
- Sodarcache
 - Allow limiting deletecache to a specific project (#448)

Changed

- General
 - Upgrade minimum Django version to 1.11.27
 - Base RemoteProjectGetAPIView on SODARCoreAPIBaseView (#442)
 - Upgrade to Chromedriver v80 (#510)
- Bgjobs
 - Make specialize_job() more robust (#456)
- Projectroles
 - Accept null value for AppSetting.value_json (#426)
 - Use PluginContextMixin in ProjectContextMixin (#430)
 - Move get_accept_header() to SODARAPIViewMixin (#445)
 - Allow exceptions to be raised by get_backend_plugin() (#451)
 - Improve tour help CSS (#438)
 - Field order in RoleAssignmentOwnerTransferView (#441)
 - Redesign user autocomplete handling in forms (#455)
 - Rename SODARUserAutocompleteWidget and SODARUserRedirectWidget (#455)
 - Disable ownership transfer link if owner is the only project user (#454)

Fixed

• Projectroles

- Potential crash in _project_header.html with ownerless kiosk mode category (#422)
- Form crash when saving a JSON app setting with user_modifiable=False (#426)
- Inconsistent plugin ordering in custom project list columns (#428)
- Project app plugins included twice in HomeView (#432)
- ProjectPermissionMixin query set override with get_project_filter_key()
- Search disabled with unchanged input value on search page load (#436)
- Subprojects queried for non-categories in project_detail.html (#434)
- Current owner selectable in ownership transfer form (#440)

Taskflowbackend

- Potential crash in TaskflowAPI initialization

Removed

- Projectroles
 - Unused backend plugins queried for context data in HomeView (#433)
 - Unneeded UserAutocompleteExcludeMembersAPIView (#455)

5.30.25 v0.7.1 (2019-12-18)

Added

- General
 - Include CHANGELOG in documentation (#379)
- Projectroles
 - widget_attrs parameter for project and user settings (#404)
 - Remote project member management link for target projects (#382)
 - Current user in get_project_list_value() arguments (#413)
 - Display category owner in page header (#414)
 - Configuring UI test settings via Django settings or TestUIBase vars (#417)
 - Initial support for deploying site in kiosk mode (#406)
 - Optional disabling of default CDN Javascript and CSS includes (#418)
 - Defining custom global JS/CSS includes in Django settings (#418)

- General
 - Change "Breaking Changes" doc into "Major Changes" (#201)
 - Refactor and rename ownership transfer classes and template
 - Use RTD theme in documentation (#384)
 - Upgrade to Chromedriver v79
- Adminalerts
 - Rename INACTIVE alert state in UI (#396)
 - Rename URL name and pattern for activation API view (#378)
 - Improve alert detail page layout (#385)
- Projectroles
 - Improve unsupported browser warning (#405)
 - Move project list description into tooltip (#388)
- Siteinfo
 - Improve page title and heading (#402)
- Sodarcache

- Clarify management command logging (#403)
- Timeline
 - Improve extra data status tab legend (#380)

- General
 - PPA used for Python 3.6 installs no longer available (#416)
- Filesfolders
 - Invalid HTML in project list extra columns
- Projectroles
 - Dismissing login error alert in login.html not working (#377)
 - Current owner queries incorrectly filtered in RoleAssignmentOwnerTransferView (#393)
 - Hardcoded project type display name in sent emails (#398)
 - Silent failing of invalid app setting type in plugin definition (#390)
 - Exception raised by hidden sidebar in sidebar height calculation (#407)
 - Crash in get_default_setting() if default JSON value was not set (#389)
 - Owner widget hidden in category update view (#394)
 - Project list extra column header alignment not set (#412)
 - get_project_list_value() template tag displaying "None" on null value (#411)

5.30.26 v0.7.0 (2019-10-09)

Added

- General
 - Development env file example env.example (#297)
 - Postgres database development setup script (#302)
 - ENABLE_DEBUG_TOOLBAR setting for local development (#349)
 - local_target2.py config for peer remote site development (#200)
- Adminalerts
 - Activate/suspend button in alert list (#42)
- Bgjobs
 - Pagination for background job list (#335)
 - BGJOBS_PAGINATION Django setting (#335)
- Projectroles
 - get_backend_include() common template tag (#261)
 - css_url member variable in BackendPluginPoint (#261)

- Example of on-demand Javascript/CSS inclusion in example apps (#261)
- Remote project link display toggle for target sites (#276)
- Project UUID clipboard copying button (#290)
- Support for app settings in site apps (#308)
- Initial implementation for common clipboard copying visualization (#333)
- Send email for owner role assignment (#325)
- Common pagination include template _pagination.html (#334)
- Synchronization and display of PEER sites in remote site management (#200)
- Link for copying remote site secret token in remote site list (#332)
- Project ownership transfer from member list (#287)
- UI notification for disabled member management on target sites (#301)
- Management command addremotesite for adding remote sites (#314)
- JSON support for app settings (#268)
- get_setting_def() in app settings API
- Timeline logging of app settings in project creation (#359)
- "Project and user" scope for app settings (#266)
- REVOKED status for remote projects with revoked access (#327)
- Project.is_revoked() helper (#327)
- Disabling access for non-owner/delegate for revoked projects in ProjectPermissionMixin (#350)

• Timeline

- Display event extra data as JSON (#6)
- Userprofile
 - User setting for project UUID clipboard copying (#290, #308)

- General
 - Upgrade Chromedriver to version 77.0.3865.40
 - Use CurrentUserFormMixin instead of repeated code (#12)
 - Run tests in parallel where applicable
 - Upgrade minimum Django version to 1.11.25 (#346)
 - General upgrade for Python package requirements (#282)
- Adminalerts
 - Use common pagination template
- Projectroles
 - Improve user name placeholder in login.html (#294)
 - Backend app Javascript and CSS included on-demand instead of for all templates (#261)

- Make sidebar hiding dynamic by content height (#316)
- Replace login_and_redirect() in UI tests with a faster cookie based function (#323)
- Refactor remote project display on details page (#196)
- Refactor AppSettingAPI (#268)
- Enable calling AppSettingAPI.get_setting_defs() with app name instead of plugin object
- Use ProjectPermissionMixin on project detail page (#350)

• Timeline

- Use common pagination template (#336)

Fixed

• Projectroles

- Output of template tag get_project_link()
- Redundant inheritance in CurrentUserFormMixin (#12)
- Trailing slashes not parsed correctly in remote project URLs (#319)
- Crash in get_project_column_count() with no active project app plugins (#320)
- UI test helper build_selenium_url() refactored to work with Chrome v77 (#337)
- Disallow empty values in RemoteSite.name
- Remote sync of parent category roles could fail with multiple subprojects
- RemoteProject modifications not saved during sync update
- Timeline events not created in remote project sync (#370)
- DAL select modifying HTML body width (#365)
- Footer overflow breaking layout (#367, #375)
- Timeline
 - Crash from exception raised by get_object_link() in a plugin (#328)

Removed

- Projectroles
 - Duplicate database indexes from RoleAssignment (#285)
 - Deprecated get_setting() tag from projectroles_common_tags (#283)
 - Project owner change from project updating form (#287)
 - ProjectSettingMixin from projectoles.tests.test_views (#357)

5.30.27 v0.6.2 (2019-06-21)

Added

- General
 - Badges for Readthedocs documentation and Zenodo DOI (#274)
- Bgjobs
 - BackgroundJobFactory for tests from Varfish-web
- Projectroles
 - Unit test to assure owner user creation during project update when using SODAR Taskflow (sodar_taskflow#49)
 - Common template tag get_app_setting() (#281)
 - Hiding app settings from forms with user_modifiable (#267)
 - AppSetting.value_json field (#268)
- Sodarcache
 - Logging in delete_cache() (#279)
- Userprofile
 - Support for AppSetting.user_modifiable (#267)

Changed

- General
 - Upgrade minimum Django version to 1.11.21 (#278)
- Projectroles
 - get_setting() template tag renamed into get_django_setting() (#281)
 - Implement project app descriptions on details page with get_info_link() (#277)

Fixed

- General
 - Documentation sections for Readthedocs

5.30.28 v0.6.1 (2019-06-05)

Added

- Filesfolders
 - Example project list columns (#265)
 - Setting FILESFOLDERS_SHOW_LIST_COLUMNS to manage example project list columns (#265)
- Projectroles
 - Optional project list columns for project apps (#265)

• Sodarcache

- delete_cache() API function (#257)

Changed

- Projectroles
 - Refactor RemoteProject.get_project() (#262)
 - Use get_info_link() in remote site list (#264)
 - Define SYSTEM_USER_GROUP in SODAR_CONSTANTS (#251)
 - Make pagedown textarea element resizeable and increase minimum height (#273)
- Sodarcache
 - Handle and log raised exceptions in synccache management command (#272)
- Userprofile
 - Disable user settings link if no settings are available (#260)

Fixed

- General
 - Chrome and Chromedriver version mismatch in Travis-CI config (#254)
- Projectroles
 - Remove redundant get_project_list() call from project_detail.html

Removed

- Projectroles
 - Unused project statistics in the home view (#269)
 - App settings deprecation protection (#245)
- Sodarcache
 - Unused TaskflowCacheUpdateAPIView (#205)

5.30.29 v0.6.0 (2019-05-10)

Added

- Filesfolders
 - Provide app statistics for siteinfo (#18)
- Projectroles
 - User settings for settings linked to users instead of projects (#16)
 - user_settings field in project plugins (#16)
 - Optional label key for settings

- Optional "wait for element" args in UI test helpers to ease Javascript testing (#230)
- get_info_link() template tag (#239)
- get_setting_defs() API function for retrieving project and user setting definitions (#225)
- get_all_defaults() API function for retrieving all default setting values (#225)
- Human readable labels for app settings (#9)
- Siteinfo
 - Add app for site info and statistics (#18)
- Sodarcache
 - Optional --project argument for the synccache command (#232)
- Timeline
 - Provide app statistics for siteinfo (#18)
- Userprofiles
 - View and form for displaying and updating user settings (#16)

Changed

- General
 - Upgrade to ChromeDriver v74 (#221)
- Bgjobs
 - Job order to match downstream Varfish
- Filesfolders
 - Update app settings (#246)
- Projectroles
 - Rename project_settings module to app_settings (#225)
 - App settings API updated to support project and user settings (#225)
 - Write an empty dict for app_settings by default

- Bgjobs
 - Date formatting in templates (#220)
- Sodarcache
 - Crash from __repr__() if project not set (#223)
 - Broken backend plugin icon (#250)

Removed

• Timeline

- Unused and deprecated project settings (#246)

5.30.30 v0.5.1 (2019-04-16)

Added

- General
 - Bgjobs/Celery updates from Kiosc (#175)
 - Default error templates in projectroles/error/*.html (#210)
- Projectroles
 - Optional user argument in ProjectAppPlugin.update_cache() (#203)
 - Migration for missing RemoteProject foreign keys (#197)
- Sodarcache
 - API logging (#207)
 - Indexing of identifying fields (#218)

Changed

- General
 - Extend projectroles/base.html for all site app templates, update docs (#217)
 - Use projectroles error templates on the example site (#210)
- Sodarcache
 - Make user field optional in models and API (#204)
 - Rename app configuration into SodarcacheConfig to follow naming conventions (#202)
 - Rename updatecache management command to synccache (#208)

- General
 - Add missing curl dependency in install_os_dependencies.sh(#211)
 - Django debug toolbar not displayed when using local configuration (#213)
- Projectroles
 - Nested app names not properly returned by utils.get_app_names() (#206)
 - Forced width set for all Bootstrap modals in projectroles.css (#209)
 - Long category paths breaking remote project list (#84)
 - Incorrect table rows displayed during project list initialization (#212)
 - Field project not set for source site RemoteProject objects (#197)

- Crash from project_base.html in site app if not overriding title block (#216)

Removed

- General
 - Django debug toolbar workarounds from project.css and project.scss (#215)
- Projectroles
 - PROJECTROLES_ADMIN_OWNER deprecation protection: use PROJECTROLES_DEFAULT_ADMIN (#190)

5.30.31 v0.5.0 (2019-04-03)

Added

- Projectroles
 - Warning when using an unsupported browser (#176)
 - Setting PROJECTROLES_BROWSER_WARNING for unsupported browser warning (#176)
 - Javascript-safe toggle for get_setting() template tag
 - ID attributes in site containers (#173)
 - Setting PROJECTROLES_ALLOW_LOCAL_USERS for showing and syncing non-LDAP users (#193)
 - Allow synchronizing existing local target users for remote projects (#192)
 - Allow selecting local users if in local user mode (#192)
 - RemoteSite.get_url() helper
 - Simple display of links to project on external sites in details page (#182)

• Sodarcache

- Create app (#169)

- General
 - Upgrade to Bootstrap 4.3.1 and Popper 1.14.7 (#181)
- Projectroles
 - Improve remote project sync logging (#184, #185)
 - Rename PROJECTROLES_ADMIN_OWNER into PROJECTROLES_DEFAULT_ADMIN (#187)
 - Update login template and get_login_info() to support local user mode (#192)

• Projectroles

- Crash in get_assignment() if called with AnonymousUser (#174)
- Line breaks in templates breaking badge-group elements (#180)
- User autocomplete for users with no group (#199)

Removed

- General
 - Deprecated Bootstrap 4 workaround from project.js (#178)

5.30.32 v0.4.5 (2019-03-06)

Added

- Projectroles
 - User autocomplete widgets (#51)
 - Logging in syncgroups and syncremote management commands
 - PROJECTROLES_DELEGATE_LIMIT setting (#21)

Changed

- General
 - Upgrade minimum Django version to 1.11.20 (#152)
 - Use user autocomplete in forms in place of standard widget (#51)
- Filesfolders
 - Hide parent folder widgets in item creation forms (#159)
- Projectroles
 - Enable allowing multiple delegates per project (#21)

- Filesfolders
 - File upload wiget error not displayed without Bootstrap 4 workarounds (#164)
- Projectroles
 - Potential crash in syncremote if run as Celery job (#160)

Removed

- General
 - Old Bootstrap 4 workarounds for django-crispy-forms (#157)

5.30.33 v0.4.4 (2019-02-19)

Changed

- Projectroles
 - Modify modifyCellOverflow() to work with non-table containers (#149)
 - Non-Pagedown form textarea height no longer adjusted automatically (#151)

Fixed

- Projectroles
 - Crash in remote project sync caused by typo in remoteproject_sync.html (#148)
 - Textarea element CSS override breaking layout in third party components (#151)

5.30.34 v0.4.3 (2019-01-31)

Added

- General
 - Codacy badge in README.rst (#140)
- Projectroles
 - Category and project display name configuration via SODAR_CONSTANTS (#141)
 - get_display_name() utils function and template tag to retrieve DISPLAY_NAMES (#141)
 - Django admin link warning if taskflowbackend is enabled

- General
 - Use get_display_name() to display category/project type (#141)
- Projectroles
 - Hide immutable fields in forms (#142)
 - Rename Django admin link in user dropdown

Fixed

- Projectroles
 - View access control for categories (#143)

Removed

- General
 - Redundant rules.is_superuser predicates from rules (#138)
- Projectroles
 - get_project_type() template tag (use get_display_name() instead)
 - Unused template _roleassignment_import.html
 - PROJECT_TYPE_CHOICES from SODAR_CONSTANTS
 - force_select_value() helper no longer used in forms (#142)

5.30.35 v0.4.2 (2019-01-25)

Added

- General
 - Flake8 and Codacy coverage in Travis-CI (#122)
 - Flake8 in GitLab-CI (#127)
- Projectroles
 - Automatically pass CSRF token to unsafe Ajax HTTP methods (#116)
 - Queryset filtering in ProjectPermissionMixin from digestiflow-web (#134)
 - Check for get_project_filter_key() from digestiflow-web (#134)

- General
 - Upgrade minimum Django version to 1.11.18 (#120)
 - Upgrade Python dependencies (#123)
 - Update .coveragerc
 - Upgrade to Bootstrap 4.2.1 (#23)
 - Upgrade to JQuery 3.3.1 (#23)
 - General code cleanup
 - Code formatting with Black (#133)
- Filesfolders
 - Refactor BatchEditView and FileForm.clean() (#128)
- Projectroles

- Use alert-dismissable to dismiss alerts (#13, #130)
- Update DataTables dependency in search.html template
- Refactor ProjectModifyMixin and RemoteProjectAPI (#128)
- Disable USE_I18N in example site settings (#117)
- Refactor ProjectAccessMixin._get_project() into get_project() (#134)
- Rename BaseAPIView into SODARAPIBaseView

• Timeline

- Refactor get_event_description() (#30, #128)

Fixed

- General
 - Django docs references (#131)
- Projectroles
 - sodar-list-dropdown layout broke down with Bootstrap 4.2.1 (#23)
 - TASKFLOW_TEST_MODE not checked for allowing SODAR Taskflow tests (#126)
 - Typo in update_remote timeline event description (#129)
 - Textarea height modification (#125)
 - Text wrapping in sodar-list-btn and sodar-list-dropdown with Bootstrap 4.2.1 (#132)
- Taskflowbackend
 - TASKFLOW_TEST_MODE not checked for allowing cleanup() (#126)
 - FlowSubmitException raised instead of CleanupException in cleanup()

Removed

- General
 - Legacy Python2 super() calls (#118)
- Projectroles
 - Custom alert dismissal script (#13)
- Example Site App
 - Example file test.py

5.30.36 v0.4.1 (2019-01-11)

Added

- General
 - Travis-CI configuration (#90)
- Adminalerts
 - Option to display alert to unauthenticated users with require_auth (#105)
- Projectroles
 - TaskflowAPIAuthentication for handling Taskflow API auth (#47)
 - Handle GET requests for Taskflow API views (#47)
 - API version settings SODAR_API_ALLOWED_VERSIONS and SODAR_API_MEDIA_TYPE (#111)
 - Site app support in change_plugin_status()
 - get_sodar_constants() helper (#112)
- Taskflowbackend
 - API logging

- General
 - Upgrade minimum Python version requirement to 3.6 (#102)
 - Update and cleanup Gitlab-CI setup (#85)
 - Update Chrome Driver for UI tests
 - Cleanup Chrome setup
 - Enable site message display in login view (#105)
 - Cleanup and refactoring for public GitHub release (#90)
 - Drop support for Ubuntu Jessie and Trusty
 - Update installation utility scripts (#90)
- Filesfolders
 - Move inline javascript into filesfolders.js
- Projectroles
 - Refactor BaseTaskflowAPIView (#47)
 - Rename Taskflow specific API views (#104)
 - Unify template tag names in projectroles_tags
 - Change default SODAR API media type into application/vnd.bihealth.sodar-core+json (#111)
 - Allow importing SODAR_CONSTANTS into settings for modification (#112)
 - Move SODAR_CONSTANTS to constants.py (#112)

• Timeline

- Rename Taskflow specific API views (#104)

Fixed

- Filesfolders
 - Overwrite check for zip archive upload if unarchiving was unset (#113)
- Projectroles
 - Potential Django crash from auth failure in Taskflow API views
 - Timeline description for updating a remote project
 - Project update with Taskflow failure if description not set (#110)
- Timeline
 - TaskflowEventStatusSetAPIView skipping sodar_token check (#109)

Removed

- Filesfolders
 - Unused dropup app buttons mode in templates (#108)
- Projectroles
 - Unused arguments in email API
 - Unused static file shepherd-theme-default.css
 - Disabled role importing functionality (#61, pending #17)
 - Unused dropup app buttons mode in templates (#108)
- Timeline
 - ProjectEventStatus.get_timestamp() helper

5.30.37 v0.4.0 (2018-12-19)

Added

- General
 - SODAR_API_DEFAULT_HOST setting for server host for API View URLs (sodar#396)
- Bgjobs
 - Add app from varfish-web (#95)
- Filesfolders
 - Add app from sodar v0.4.0 (#86)
- Projectroles
 - Setting PROJECTROLES_ENABLE_SEARCH (#70)
 - Re-enable "home" link in project breadcrumb (#80)

- get_extra_data_link() in ProjectAppPluginPoint for timeline extra data (#6)
- Allow overriding project class in ProjectAccessMixin
- Optional disabling of categories and nesting with PROJECTROLES_DISABLE_CATEGORIES (#87)
- Optional hiding of apps from project menus using PROJECTROLES_HIDE_APP_LINKS (#92)
- Secure SODAR Taskflow API views with TASKFLOW_SODAR_SECRET (#46)

Taskflowbackend

- test_mode flag configured with TASKFLOW_TEST_MODE in settings (#67)
- Submit sodar_secret for securing Taskflow API views (#46)
- Timeline
 - Display of extra data using {extra-NAME} (see documentation) (#6)

Changed

- General
 - Improve list button and dropdown styles (#72)
 - Move pagedown CSS overrrides into projectroles.css
 - Reduce default textarea height (#96)
- Projectroles
 - Make sidebar resizeable in CSS (#71)
 - Disable search if PROJECTROLES_ENABLE_SEARCH is set False (#70)
 - Allow appending custom items in project breadcrumb with nav_sub_project_extend block (#78)
 - Allow replacing project breadcrumb with nav_sub_project block (#79)
 - Disable remote site access if PROJECTROLES_DISABLE_CATEGORIES is set (#87), pending #76
 - Disable access to invite views for remote projects (#89)
 - Set "project guest" as the default role for new members (#94)
 - Make noncritical settings variables optional (#14)

Fixed

- General
 - Potential inheritance issues in test classes (#74)
 - LDAP dependency script execution (#75)
- Projectroles
 - Long words in app names breaking sidebar (#71)
 - Member modification buttons visible for superuser in remote projects (#73)
 - Breadcrumb project detail link display issue in base.html (#77)
 - "None" string displayed for empty project description (#91)
 - Crash in search from empty project description

5.30.38 v0.3.0 (2018-10-26)

Added

- General
 - Test config and script for SODAR Taskflow testing
- Adminalerts
 - Add app based on SODAR v0.3.3 (#27)
 - TASKFLOW_TARGETS setting
- Projectroles
 - RemoteSite and RemoteProject models (#3)
 - RemoteSiteAppPlugin site plugin (#3)
 - PROJECTROLES_SITE_MODE and PROJECTROLES_TARGET_CREATE settings (#3)
 - Remote site and project management site app (#3)
 - Remote project API (#3)
 - Generic SODAR API base classes
 - SodarUserMixin for SODAR user helpers in tests
 - Optional readme and sodar_uuid args for _make_project() in tests
 - syncremote management command for calling RemoteProjectAPI.sync_source_data()
 - get_project_by_uuid() and get_user_by_username() template tags
 - get_remote_icon() template tag (#3)
 - Predicates in rules for handling remote projects (#3)
 - ProjectModifyPermissionMixin for access control for remote projects (#3)
 - is_remote() and get_source_site() helpers in the Project model (#3)
 - Include template _titlebar_nav.html for additional title bar links
- Taskflowbackend
 - Add app based on SODAR v0.3.3 (#38)
- Timeline
 - RemoteSite model in api.get_event_description() (#3)

- General
 - Update documentation for v0.3 changes, projectroles usage and fixes to v0.2 docs (#26)
- Adminalerts
 - Make ADMINALERTS_PAGINATION setting optional
- Projectroles
 - Allow LoggedInPermissionMixin to work without a permission object for superusers

- Enable short/full title selection and remote project icon in get_project_link() template tag
- Refactor rules
- Disable Taskflow API views if Taskflow backend is not enabled (#37)
- DataTables CSS and JS includes loaded in the search template (#45)
- Timeline
 - Minor refactoring of api.get_event_description() (#30)

Fixed

- General
 - Pillow dependency typo in requirements/base.txt (#33)
 - Login page crash if AUTH_LDAP*_DOMAIN_PRINTABLE not found (#43)
- Projectroles
 - Sidebar create project visible for site apps if URL name was "create" (#36)
 - Enabling LDAP without a secondary backend caused a crash (#39)

Removed

- General
 - iRODS specific CSS classes from projectroles.css
 - App content width limit in projectroles.css
 - Domain-specific Login JQuery
 - DataTables CSS and JS includes from base template (#45)

5.30.39 v0.2.1 (2018-09-20)

- General
 - Change omics_uuid field in all apps' models to sodar_uuid (sodar#166)
- Projectroles
 - Rename abstract OmicsUser model into SODARUser (sodar#166)
 - Rename OMICS_CONSTANTS into SODAR_CONSTANTS (sodar#166)
 - Rename the omics_constant() template tag into sodar_constant() (sodar#166)
 - Rename omics_url in sodar_taskflow tests to sodar_url (see sodar_taskflow#36)
 - Rename shepherd-theme-omics.css to shepherd-theme-sodar.css (sodar#166)

5.30.40 v0.2.0 (2018-09-19)

Added

- General
 - example_backend_app for a minimal backend app example
 - Backend app usage example in example_project_app
- Timeline
 - Add timeline app based on SODAR v0.3.2 (#2)
 - App documentation

Changed

- General
 - Update integration documentation (#1)
 - Restructure documentation files and filenames for clarity
- Timeline
 - Update CSS classes and overrides
 - Rename list views to list_project and list_objects
 - Rename list template to timeline.html
 - Refactor api.get_event_description()
 - Make TIMELINE_PAGINATION optional
 - Improve exception messages in api.add_event()

Fixed

- Timeline
 - User model access in timeline.api
 - Misaligned back button (#4)
 - Deprecated CSS in main list
- Projectroles
 - Third party apps not correctly recognized in get_app_names()

5.30.41 v0.1.0 (2018-09-12)

Added

- General
 - Create app package for Projectroles and other reusable apps based on SODAR release v0.3.1
 - example_project_app to aid testing and work as a minimal example
 - example_site_app for demonstrating site apps
 - SITE_TITLE and SITE_INSTANCE_TITLE settings
 - SITE_PACKAGE setting for explicitly declaring site path for code
 - Documentation for integration and development
 - Separate LDAP config in install_ldap_dependencies.sh and requirements/ldap.txt

• Projectroles

- static_file_exists() and template_exists() helpers in common template tags
- Abstract OmicsUser model
- get_full_name() in abstract OmicsUser model
- auth_backends.py file for LDAP backends (sodar#132)
- Versioneer versioning
- core_version() in common template tags
- Check for footer content in include/_footer.html
- Example of the site base template in projectroles/base_site.html
- Example of project footer in projectroles/_footer.html

• Userprofile

- Add site app userprofile with user details
- Display user UUID in user profile

- Projectroles
 - Move custom modal into projectroles/_modal.html
 - Check for user.name in user dropdown
 - Move content block structure and sidebar inside projectroles/base.html
 - Move site title bar into optional include template projectroles/_site_titlebar.html
 - Move search form into optional include template projectroles/_site_titlebar_search.html
 - Make title bar dropdown inclueable as _site_titlebar_dropdown.html
 - Title bar CSS and layout tweaks
 - Move search.js under projectroles
 - Move projectroles specific javascript into projectroles.js

- Move site_version() into common template tags
- Move title bar admin and site app links to user dropdown (sodar#342)
- Move project specific CSS into optionally includable projectroles.css
- Refactor and cleanup CSS
- Move set_user_group() into projectroles.utils
- Move syncgroups management command into projectroles
- Copy improved multi LDAP backend setup from flowcelltool (sodar#132)
- Move LDAP authentication backends into projectroles (sodar#132)
- Move login.html into projectroles
- Display SITE_INSTANCE_TITLE in email instead of a hardcoded string
- Display the first contact in settings. ADMINS in email footer
- Use get_full_name() in email sending
- Get site version using SITE_PACKAGE
- Get LDAP domain names to login template from settings
- Rename custom CSS classes and HTML IDs from omics-* into sodar-* (sodar#166)
- Move Shepherd theme CSS files into projectroles

Fixed

- Projectroles
 - Tests referring to the filesfolders app not included in this project
 - TestHomeView.test_render() assumed extra SODAR system user was present (see sodar#367)
 - Tour link setup placing
- Userprofile
 - Missing user name if name field not filled in user_detail.html

Removed

- Projectroles
 - Deprecated Javascript variables popupWaitHtml and popupNoFilesHtml
 - Unused template irods_info.html
